### 2021 Workshop on Gravitational Waves and **High-Performance Computing Geoffrey Lovelace**

August 16, 2021 – August 20, 2021

## Welcome to the workshop!

- such as:
  - A photo of you e.g.

- Workshop supported by the **National Science Foundation**
- Websidte with useful materials: https://geoffrey-lovelace.com/Workshop/2021

• Please make sure you create a **free** account at <u>https://cocalc.com</u>

• Please find a profile picture that is clear, friendly, and recognizable,

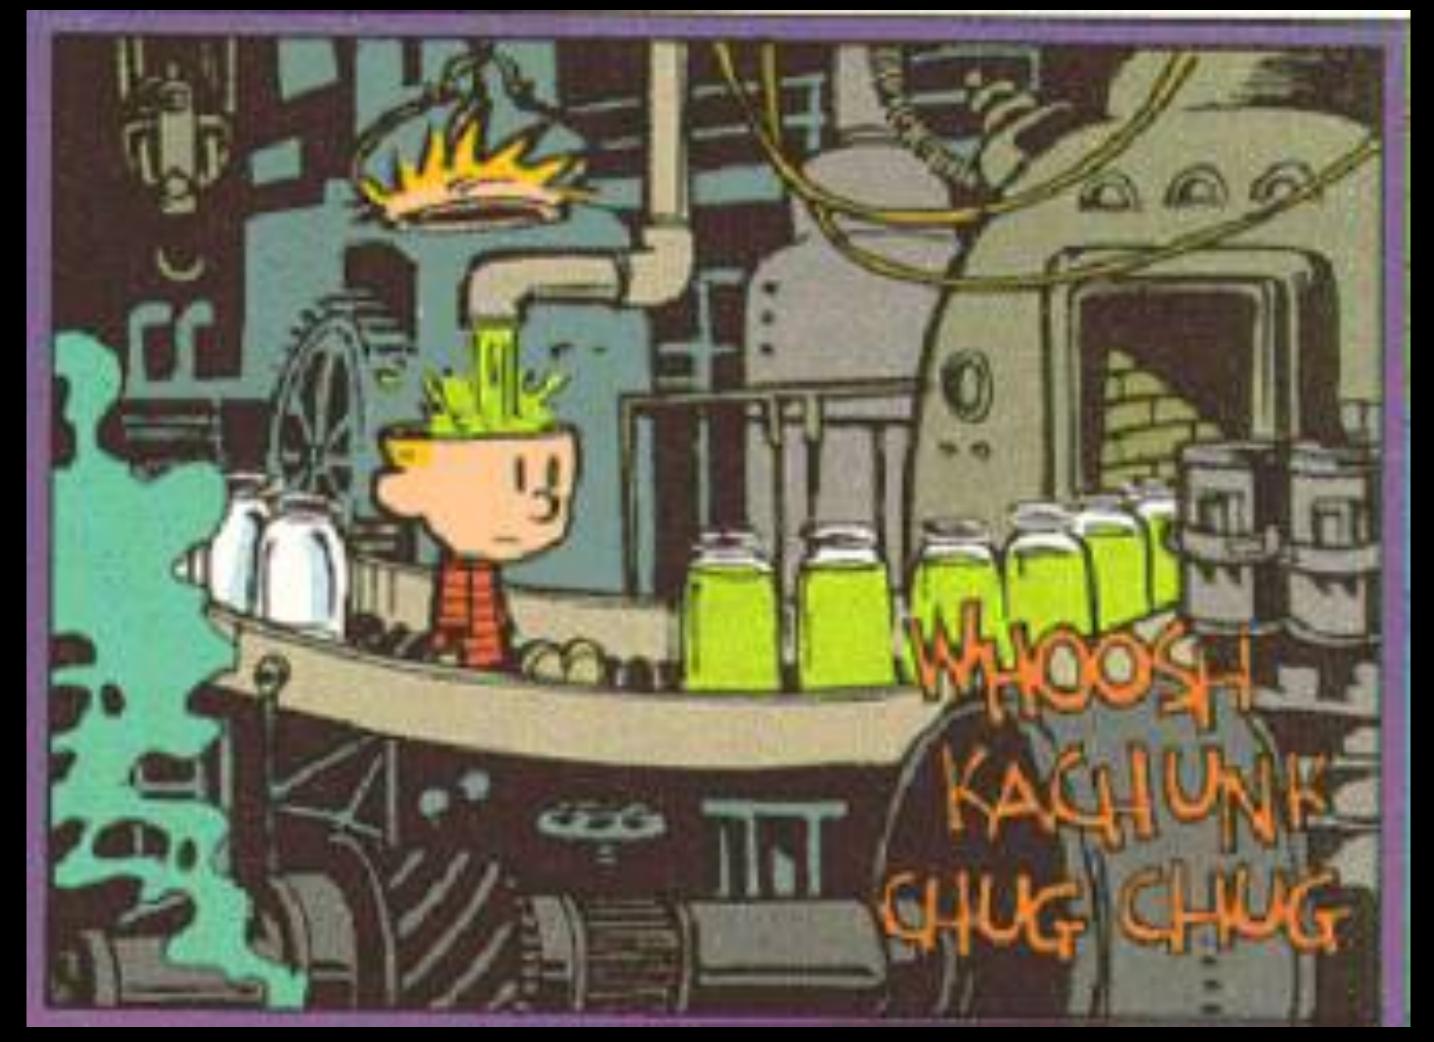

An avatar from bitmoji.com, getavataaars.com, hexatar.com, ...

- We would like to take some "photos" (zoom screenshots) during the workshop
- The photos would appear on the Cal State Fullerton website, in news stories about the workshop
- If you would prefer to not have your picture taken, please feel free to turn off your camera

## Photos

### A commonly held inaccurate model of teaching and learning

Joe Reddish, 2001, AAPT, San Diego

#### Bill Watterson - Calvin and Hobbs

### Results from cognitive science and education research

what you already know. Most people learn best when interacting with others.

- Learning requires mental effort.
- New information must link with

# Daily schedule

- Morning: 9:30 AM 11:00 AM
- Afternoon I: 12:30 PM 2:00 PM
- Afternoon II: 2:30 PM 4:00 PM

## Tentative schedule

- Monday: Powers of 10 & computing, programming with Python
- **Tuesday**: Programming with Python, Unix Command Line, using a supercomputer
- Wednesday: Simulating colliding black holes, black holes, gravitational waves
- Thursday: Gravitational-wave research, panel discussion
- Friday: visualizing colliding black holes, exit survey

# About the pace...

- The pace is intense: you'l be learning a lot
- It's normal to feel confused...that's actually what learning feels like
- There is no such thing as a dumb question!!
- You will get the most out of this experience by participating! It's more like learning a sport or a musical instrument or a language or ...

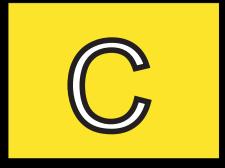

### GWT PAC GRAVITATIONAL WAVE Physics and Astronomy Center

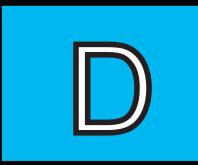

#### Which brother am I?

Both

#### Neither

Not sure

## **Cebreaker**

 If you had to gain one superpower, which one would you choose?

Ability to fly

Power to be invisible

Powers of 10 & computers

- First entities called "computers" were teams of people
- Divide up the work into operations done in parallel, by hand (perhaps with mechanical aid)
- Redundant calculations to check accuracy
- Since 1700s
- 10<sup>-1</sup> to 1 FLOPS / human (decimal operations / second / human)

Image courtesy wikipedia

#### Fumans

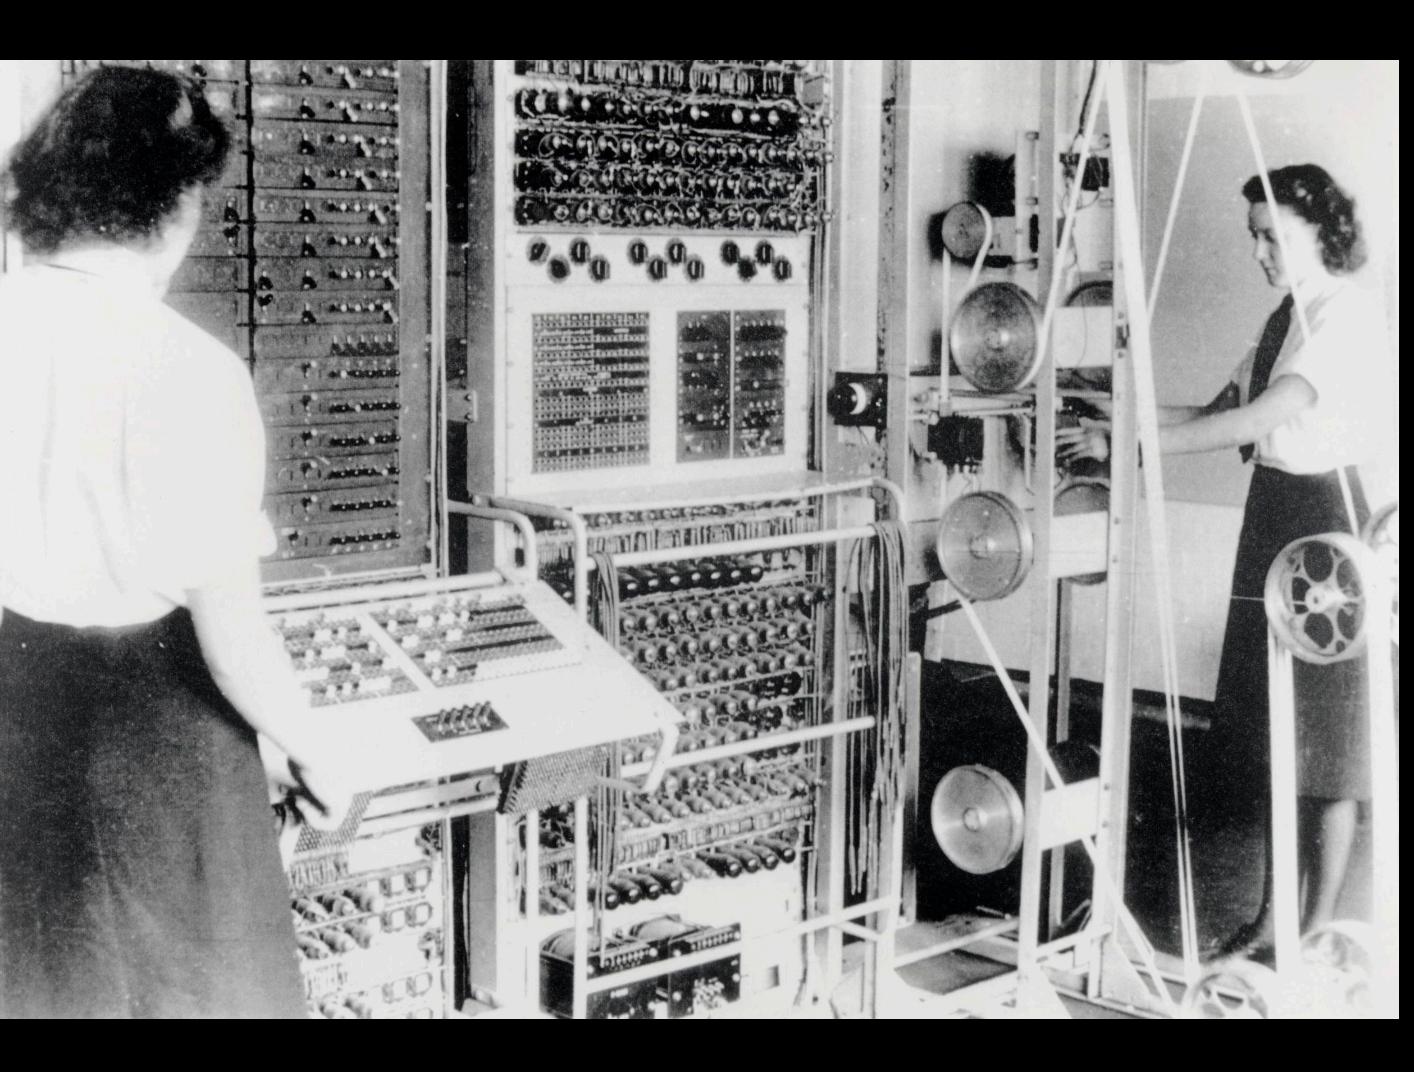

#### 1949 NACA High Speed Flight Station "Computer Room")

# **Colossus (1942)**

- First programmable, digital, electronic computer
- Break codes in World War II Britain
- 5 x 10<sup>5</sup> FLOPS

Image courtesy wikipedia

#### First Macintosh • 1 x 10<sup>6</sup> FLOPS

Image courtesy wikipedia

# My first Mac (1984)

# My Mac in 2003

- 2 cores
- 2 x 10<sup>9</sup> FLOPS

## Ocean supercomputer at Cal State Fullerton

- Supercomputer for Cal State Fullerton Gravitational-Wave Physics and Astronomy Center
- 824 cores
- ≈ 10<sup>12</sup> 10<sup>13</sup> FLOPS

- Most powerful computer I have used
- 70,000 cores
- 1 x 10<sup>16</sup> FLOPS

## Bue Waters

#### Image courtesy Blue Waters

- First exaflop computer (with graphics cards)
- 200,000 cores
- 2 x 10<sup>17</sup> FLOPS

## Summit

#### Supercomputer Fugaku

- Current fastest computer in the world
- Kobe, Japan
- 7.6 million cores
- 1 x 10<sup>18</sup> FLOPS

#### Image courtesy Riken & Fujitsu

## High performance computing

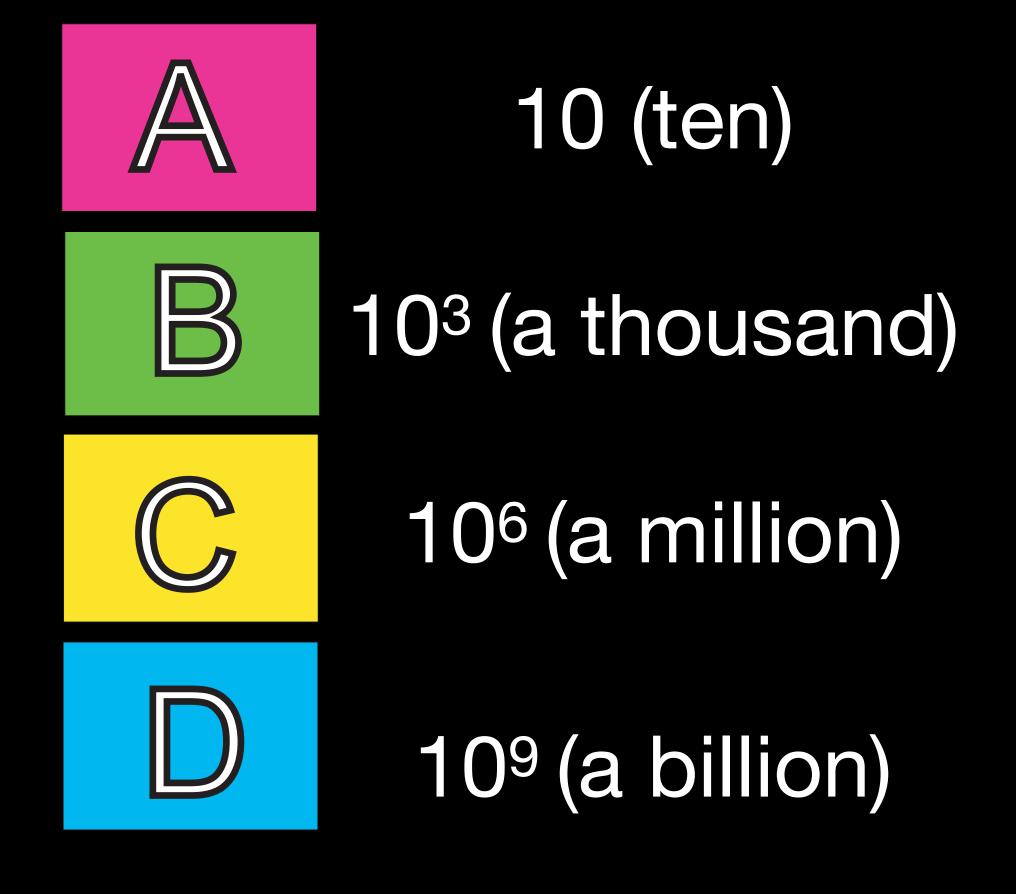

- Computing beyond what personal devices can do
  - Many cores
     work together
     in parallel

FLOPS	Example	Computing T
100	Addition by human with pen & paper	Early
<b>10</b> <sup>3</sup>	Room-sized computer in 1940s	
106	1980s personal computers (1984)	Personal
109	Personal computers around year 2000

In 1 second, the most powerful computer in the world can perform as many calculations
 as \_\_\_\_\_humans?

For comparison:

Humans alive in 2018: 7.6 x 10<sup>9</sup> Total humans who ever lived: 10<sup>11</sup> Sources: google.com, pro.org

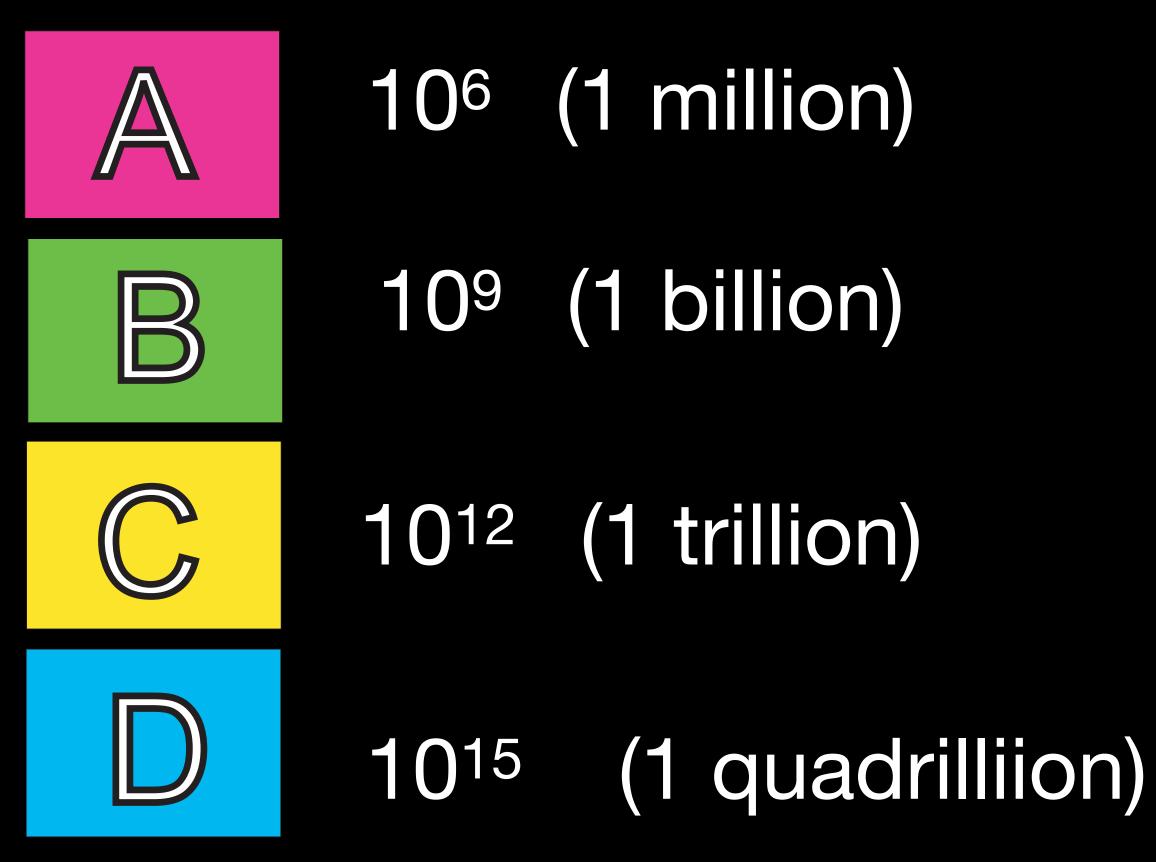

can perform as many calculations as humans?

#### For comparison:

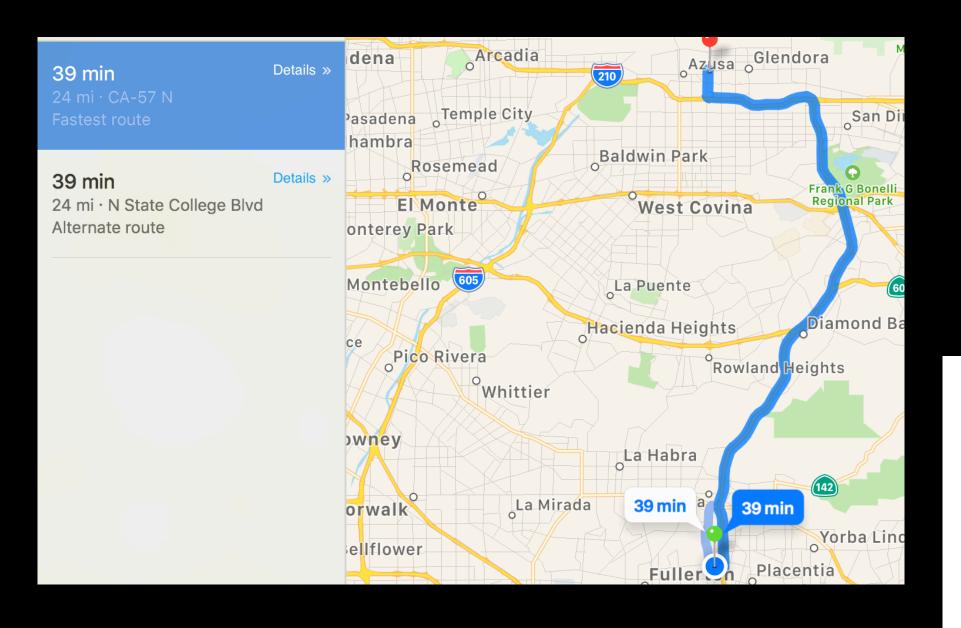

Humans alive in 2018: 7.6 x 10<sup>9</sup> Total humans who ever lived: 10<sup>11</sup> Sources: google.com, pro.org

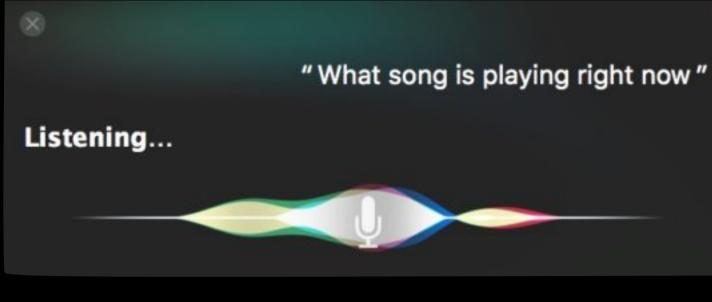

## • In 1 second, a small supercomputer like Ocean

## High-performance computing in everyday life

- Cloud computing
  - Search the web
  - Identify a song
  - Get directions
  - Voice assistants
  - Speech recognition

Google Search

I'm Feeling Lucky

### Example: Google search

- Search ~ 10<sup>13</sup> web pages
- 10<sup>3</sup> "servers" per query
- Each query takes about
   0.2 seconds
- 4 x 10<sup>4</sup> queries on average every second of every day

1,600,000,000,000

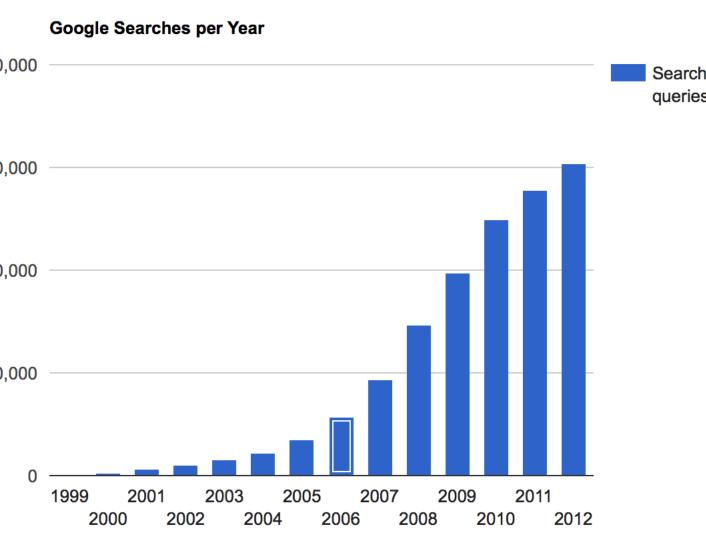

1,200,000,000,000

800,000,000,000

400,000,000,000

 If each server is "only"10<sup>9</sup> FLOPS, Google search requires about 10<sup>16</sup> FLOPS

Images courtesy Google, internetlivestats.com

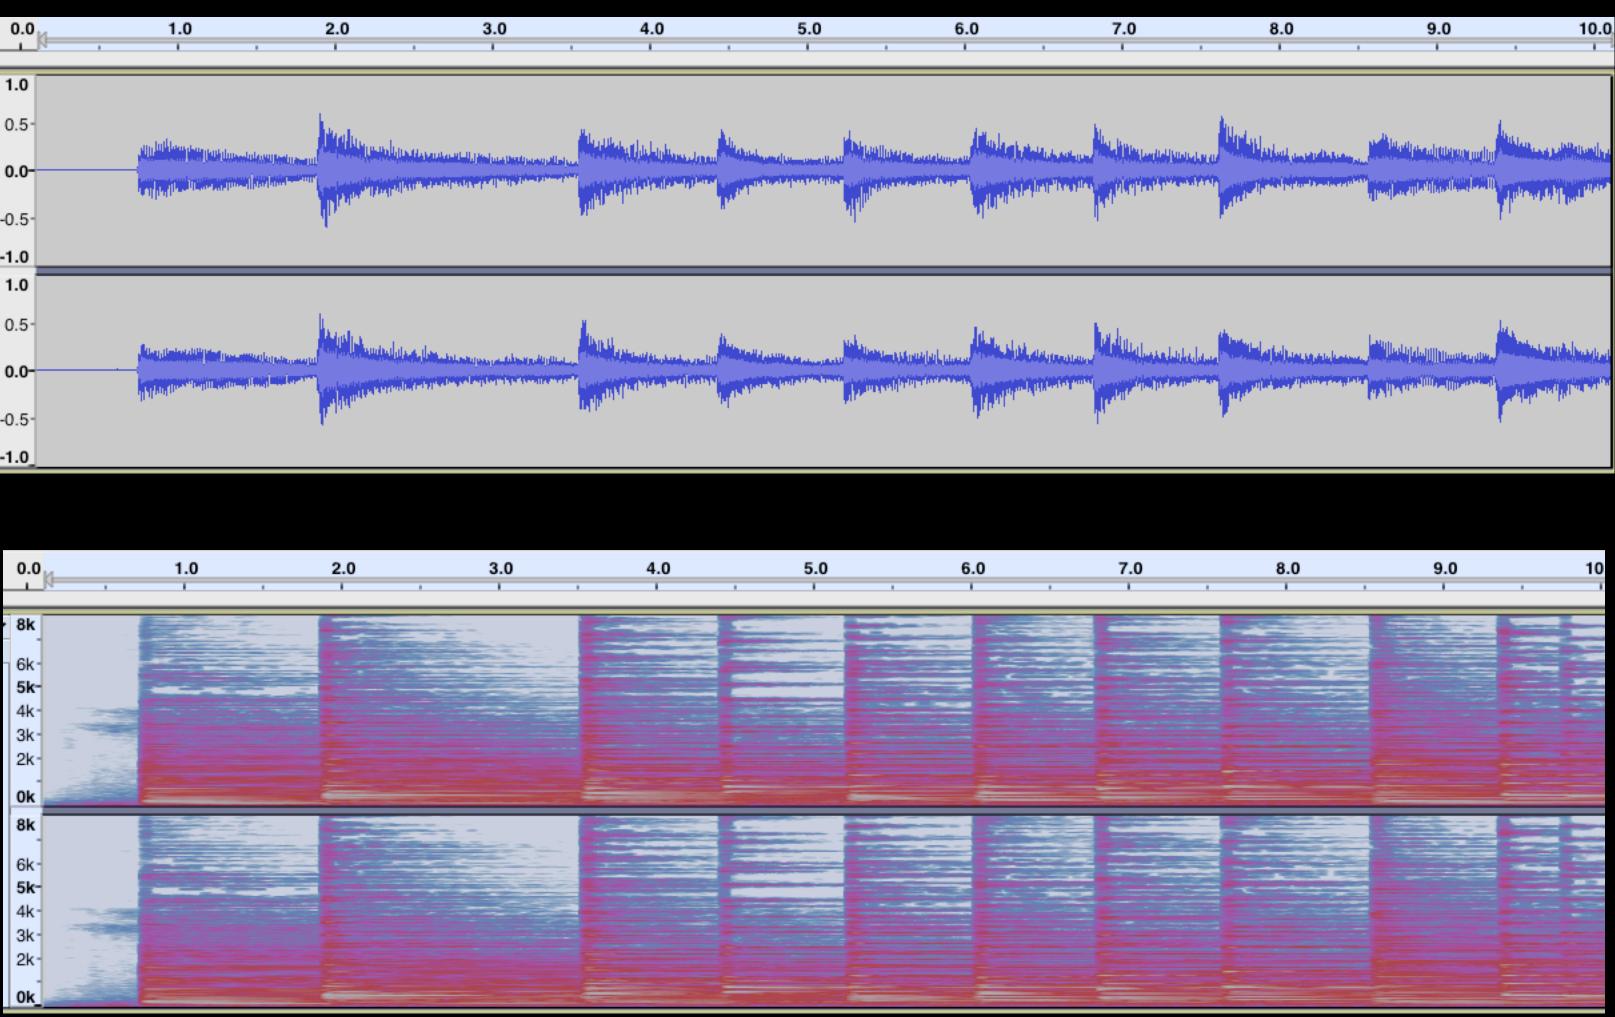

Year

## Example: Shazam

- 200 queries on average every second of every day
  - Convert sound into timefrequency plots, filter to keep only the loudest notes
  - Compare to a large library
  - Similar to how LIFO searches data for gravitational waves!
  - One query is a PC-sized calculation, roughly

# High-performance computing for science

- Solve otherwise unsolvable problems
- Insight into scientific data & results
  - Experimental measurements
  - Results of calculations
  - Complicated pencil & paper results

Movie & calculation by undergraduate Haroon Khan, Nick Demos, Simulating eXtreme Spacetimes collaboration

# Example: Simulating colliding black holes

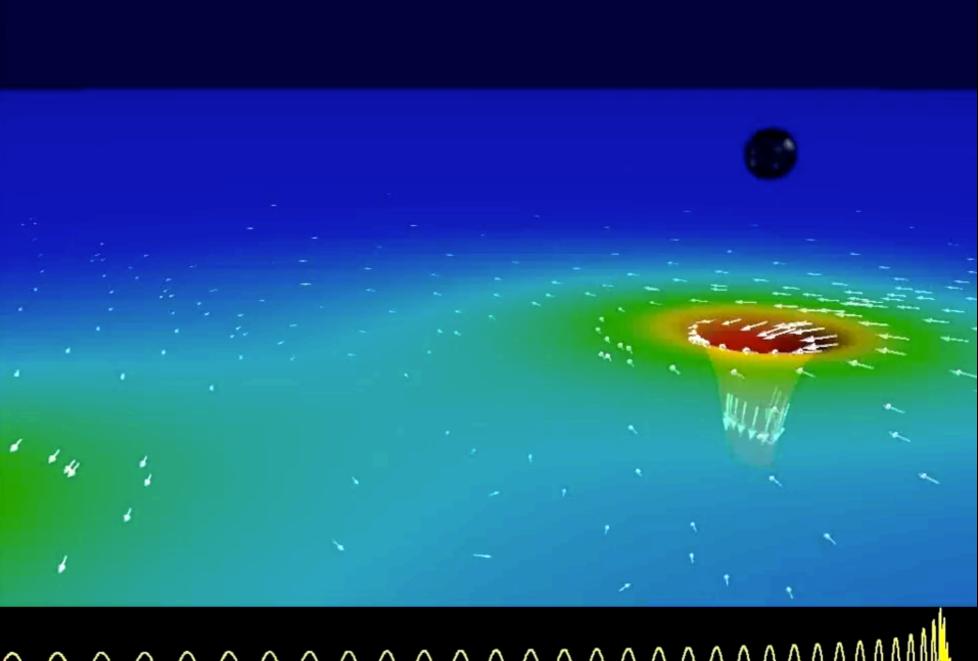

- Head-on collision example
  - About 1.4 x 10<sup>17</sup> floating-point operations
  - 3 days (48 (slower) cores on ocean)
  - Several weeks on a typical laptop
- Inspiral, merger, ringdown example
  - About 7.8 x 10<sup>17</sup> floating-point operations
  - 17 days (48 cores before merger, 36 cores after, on orca)
  - Months on a typical laptop

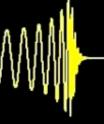

Binary Black Hole Evolution: Caltech/Cornell Computer Simulation

Top: 3D view of Black Holes and Orbital Trajectory

Middle: Spacetime curvature: Depth: Curvature of space Colors: Rate of flow of time Arrows: Velocity of flow of space

Bottom: Waveform (red line shows current time)

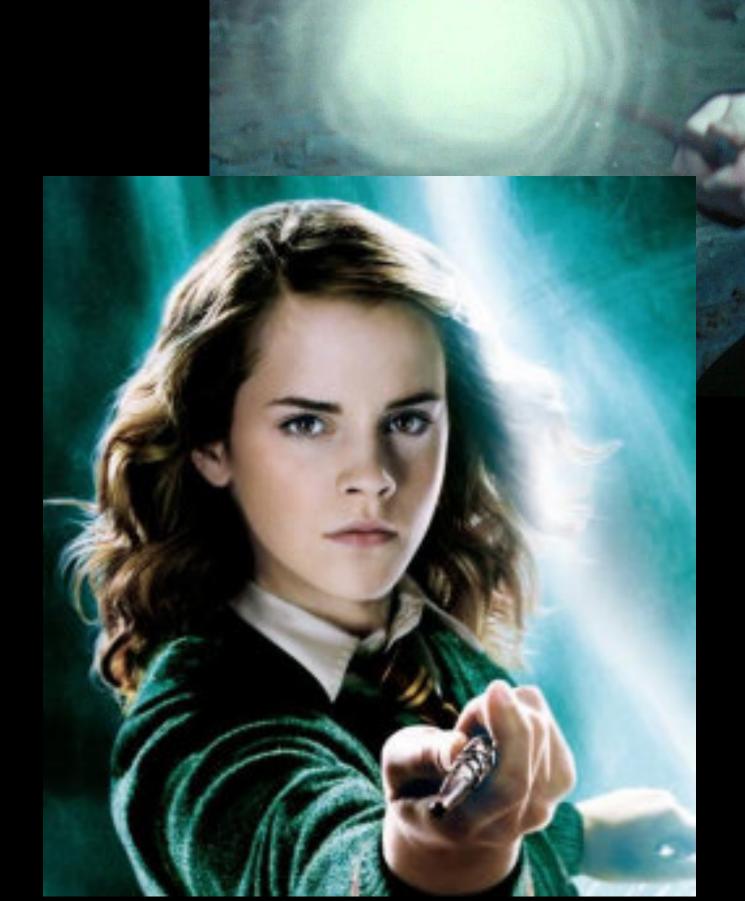

## Programming with Python

### Programming is like magic

- Say the right cryptic words and something cool happens
- Mess up a word and the spell fizzles

Images courtesy Warner Bros.

### Google colaboratory

- https:// colab.research.google.com
- Google lets us program and run on their computers for free

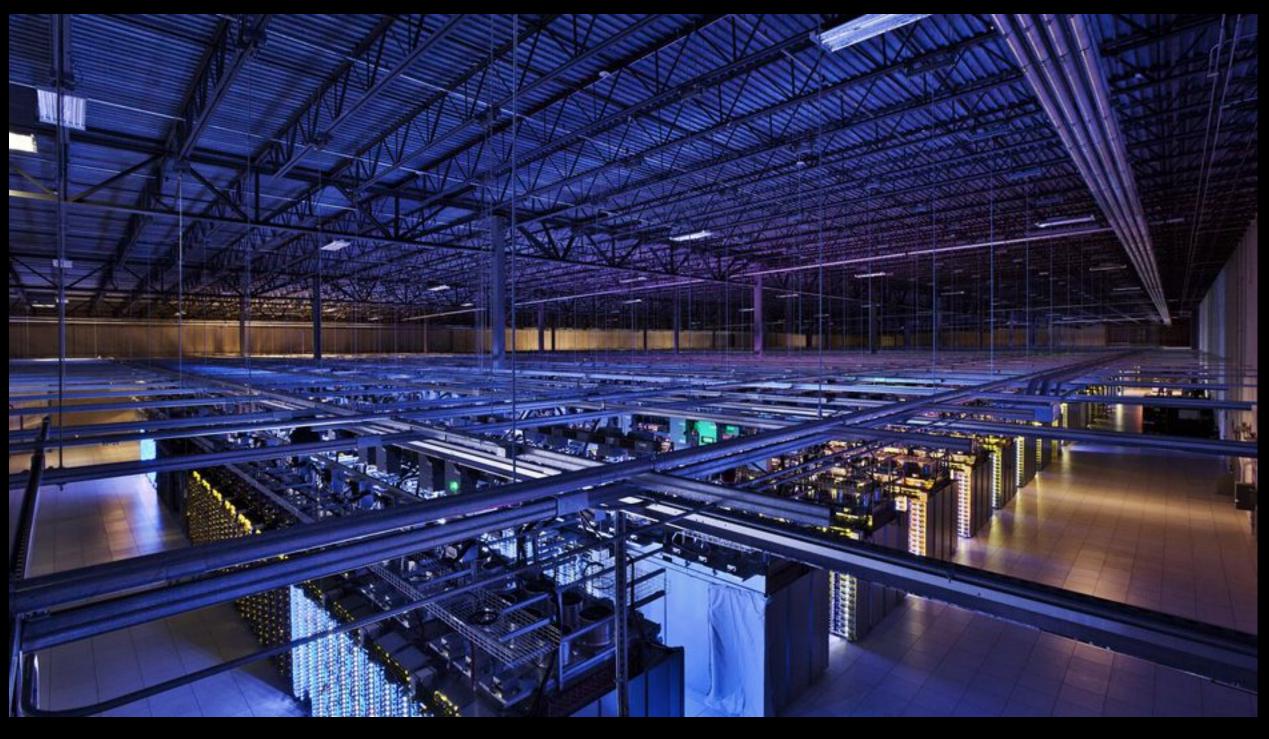

Image courtesy cnet: Google data center, Council Bluffs, Iowa

- https://cocalc.com
- Hosted by Google
- Limited free service
  - This course: ~\$20/month paid plan (I paid, don't worry!)

- Your program needs to tell you the result
- Tradition since 1974: first program prints "Hello world"
- Python (language commonly) used in scientific computing) makes this easy

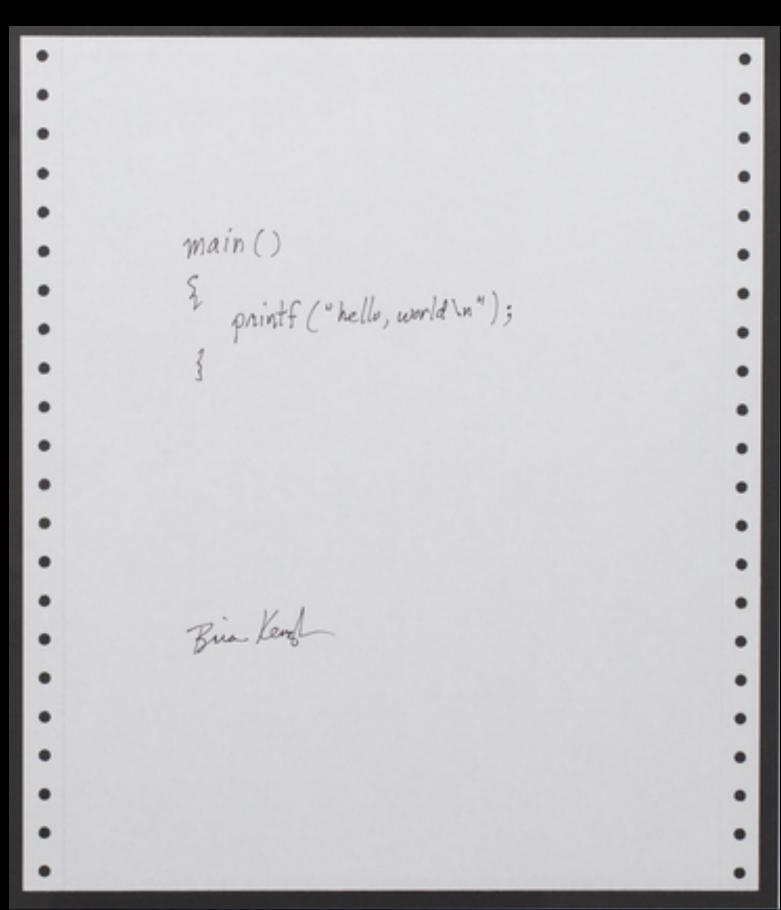

### **Iry:**

Try:

### print("Hello, world!")

 Print basically anything print(4\*4+4-4)

# Output

**Brian Kernighan** (early UNIX developer), 1978

### Libraries

- Don't reinvent the wheel when you want to hit the road
  - (But OK if you want to learn how to make wheels)
- Python has *many* libraries for numerical computing & everything else
- By "Libraries", I mean any pre-written code that you can use in your programs

### Try in tutor:

import math
print(math.pi)

- Exponents with \*\*
- Scientific notation
- The rest in the math library

### Nath Try in tutor (only type the left hand side of the ==):

• Arithmetic operations built in (4 + 4) + 4 - 4

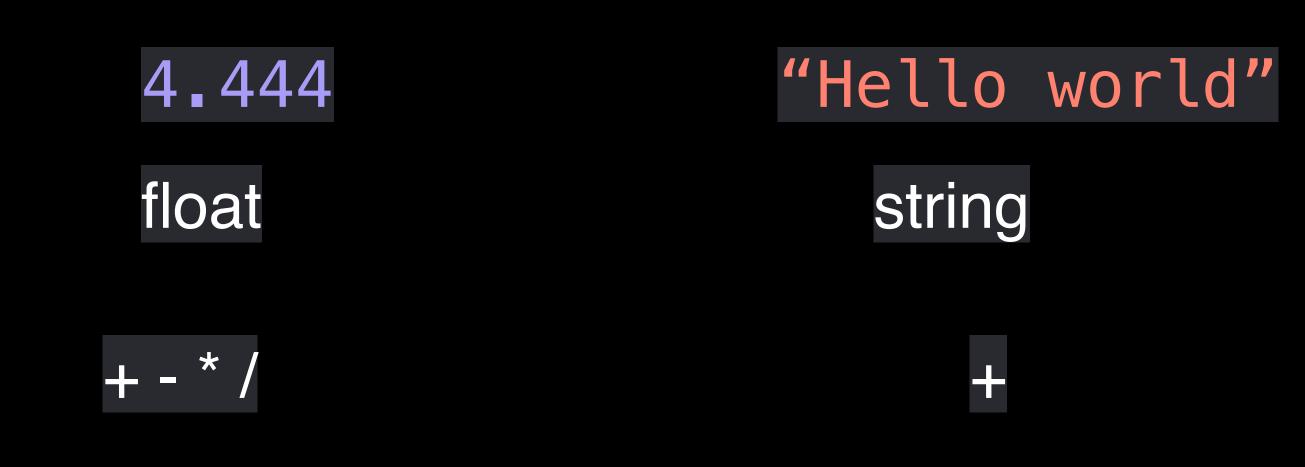

4 \*\* 4 == 256

4e4 == 40000

 $math_sin(4)$ math\_sqrt(4)

### Expressions

- Value = piece of data of a particular type
- Type = kind of data
- Operator = combine values to get a new value
  - Behavior depends on type
- Expression = group of values and operators
- Python evaluates expressions, like a calculator

#### 4.0\*3.0-2.0 "Hello"+" world"

### Clicker question #2.0

### What does Python get when it evaluates this expression?

4.0\*3.0-2.0

4.0

10.0

Some other number

An error

### Try out some expressions

4.0\*3.0-2.0

"Hello" + " world"

### Try out some expressions

print(4.0 \* 3.0 - 2.0)

print("Hello" + " world")

#make up your own

### Some types we will need

- Float
- Int
- String
- Boolean

## ype: float

- - Examples 4.1234
- **Operators:** + \* / \*\*

Try in tutor: print(22.0/7.0)print(-3.0e-3 \* 10.0)

#### • Values: real numbers ("numbers with decimal points")

4	4.0	4.4e2	-5.2e-3
---	-----	-------	---------

• If you don't include a decimal point, it is an integer!

print(8.0\*\*2.0)

print(1.0/3.0)

print(type(4)) print(type(4.0))

- Values: integers (whole numbers, positive, negative, zero)
  - - Don't use commas when typing an int or float
- Operators: + \* \*\* / // %
- Try in tutor: print(2\*\*8) print(4 \* 3 - 2)

### **Iype: int**

- print(7/3) #float in Python3, #int in Python2 (avoid!)
- print(7 // 3) # quotient print(7 % 3) # remainder

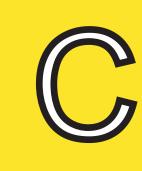

### Clicker question #2.1

## In Python 3, what is the value of this expression? 10 // 3 + 1

4

4.3333333333

Some other number

An error

#### • Values: true or false

#### Examples True

#### and or not • Operators:

- is true if both are true, false otherwise a and b
- a or b

not a

- is true if a is true, b is true, or both are true is false if both a and b are false
- is true if a is false, false if a is true

### Type: boolean

• = stores results in a named object ("variable")

#### • == tests whether two objects are equal

### 

#### myNumber = 4print(myNumber \* myNumber)

print(myNumber \* myNumber == 16) True

print(2 + 2 == 5)False

## Try some of these

- stores results in a named object ("variable")
- == tests whether two objects are equal

print(2 + 2 == 4 and 3 + 3 == 6) print(2 + 2 == 4 and 3 + 3 == 7) print(2 + 2 == 4 or 3 + 3 == 7)print(not 3 + 3 == 7) a = Trueb = Truec = Falsed = False

# Pick a few of these print(a) print(not c) print(not a) print(a or b) print(a or c) print(c or d) print(a and b) print(a and c) print(c and d)

### Converting types Try in tutor:

### q = 4 print("The number is "+q)

### q = 4 print("The number is "+str(q))

print(type(4))
print(type(str(4)))
print(type(float(4)))

# Clicker question #2.2

• What does this line print?

#### **import** math print("The value of pi is "+math.pi)

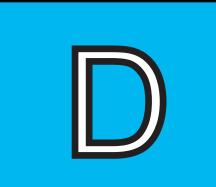

The value of pi is 3.141592653589793

The value of pi is math.pi

Something else but not an error

An error

# Clicker question #2.2

• What does this line print?

**import** math print("The value of pi is "+str(math.pi))

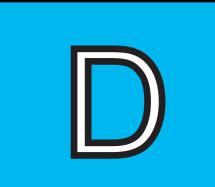

The value of pi is 3.141592653589793

The value of pi is math.pi

Something else but not an error

An error

### Comments

- Comments explain what you're doing
- Use comments to explain your code
- Use names that help explain, even without comments

# Say hello to someone by name personName = "Geoffrey" print("Hello " + personName)

Go to cocalc Day2.ipynb

- Input(s) ("arguments")
- Returns output
- Functions can call other functions

### Functions

#### Try in cocalc (YOU -> your initials)! def square\_YOU(x): return x\*x square\_YOU(4) 16

- Define a function that takes a decimal x and returns cos(cos(x))
  - Hint: use math.cos()
- Print the result for some test number

# Activity

- Define a function "cos2Times" that takes a decimal x and returns COS(COS(X))
  - Hint: use math.cos()
- Print the result

# Activity

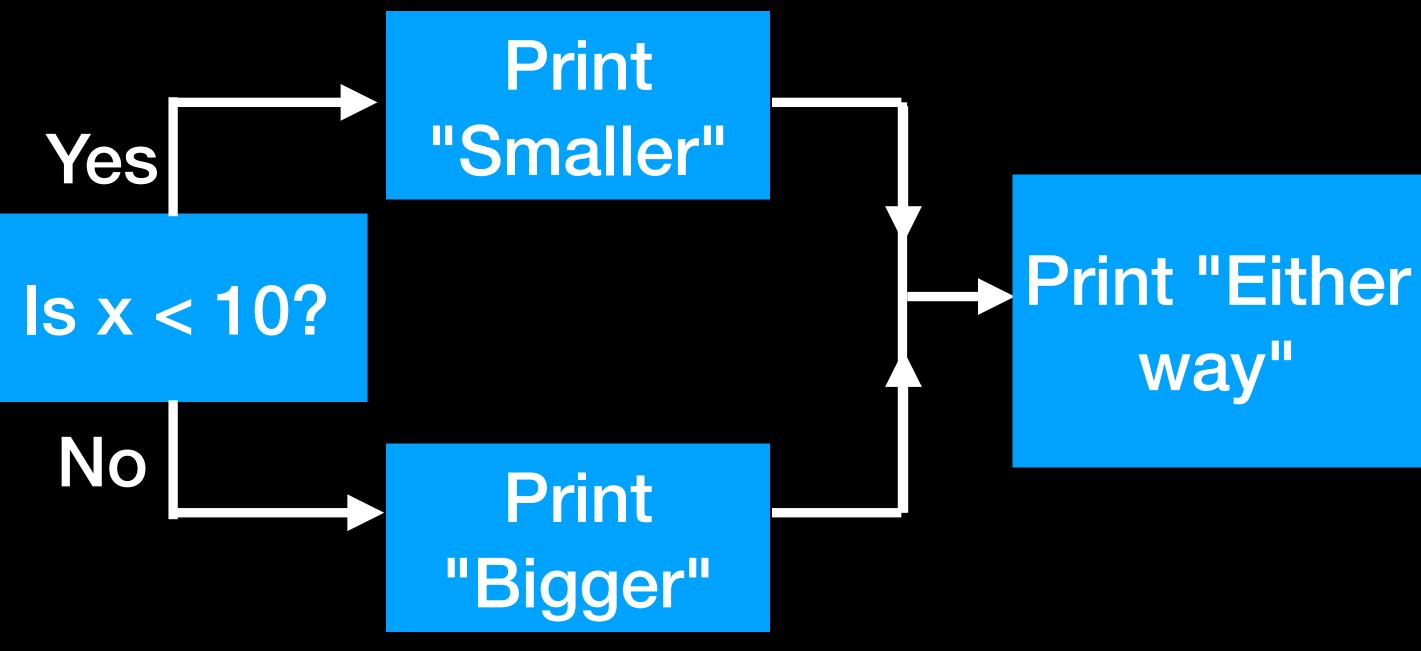

import math def cos2Times(x): return math.cos(math.cos(x)) print(cos2Times(44.44)) print(cos2Times(0.0))

- If does the first indented thing if the stuff in () is True
- Otherwise it does the indented stuff under "else"

 $\mathbf{x} = \mathbf{4}$ 

Store 4 in an object called x

### If/else Try in cocalc! if(x < 10):print("Smaller") else: print("Bigger") print("Either way.")

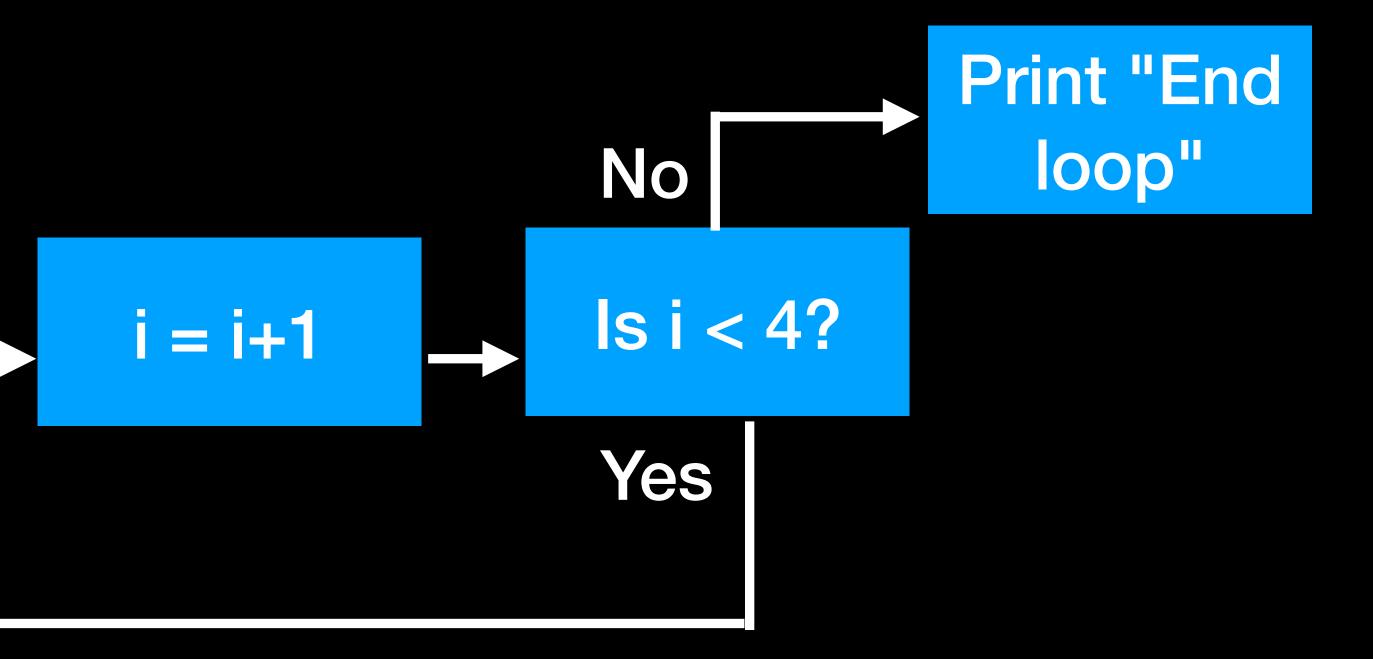

#### Try in tutor! i = 0 while i < 4: print(i\*i) i = i + 1print("End loop")

Print i\*i

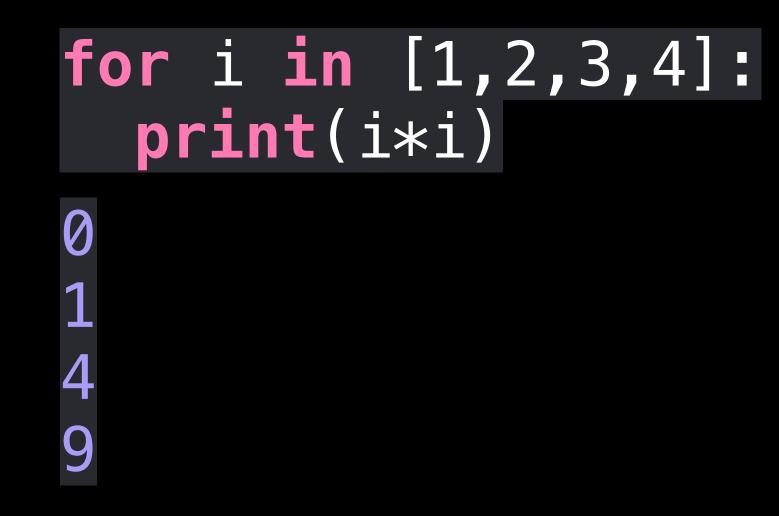

0 4 9

### Store 0 in an object called i

### LOODS

### So far, our programs just run & stop... How do programs with a user interface work?

### LOODS = 0 while i < 4: print(i\*i) = i + 1

### Real life: event loop

• Event = key press, mouse/trackpad click,

### LOODS

#### while message != quit: message = get\_next\_message() process\_message(message)

### My first program

#### PRINT "GEOFFREY" 10 20 GOTO 10

done = False while not done: print("Geoffrey")

• What does this program print?

x = 4
if x==10:
 print('yes')
else:
 print('no')

Yes

The code gives an error

• What does this program print?

x = 4
if x==10 or x==11:
 print('yes')
else:
 print('no')

Yes

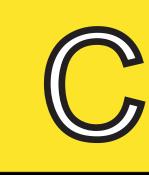

The code gives an error

• What does this program print?

x = 4
if x==10 or 11:
 print('yes')
else:
 print('no')

Yes

The code gives an error

What does this program print?

while j < 3:</pre> j = j + 1 print(j)

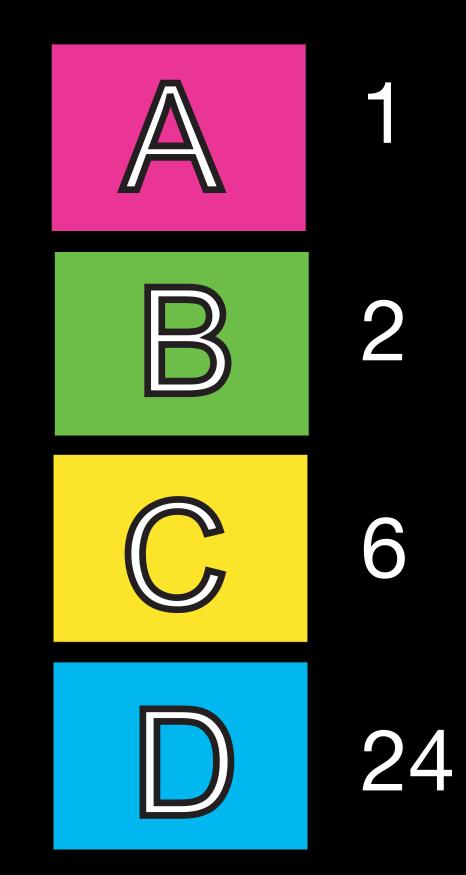

- 2 3
  - 4

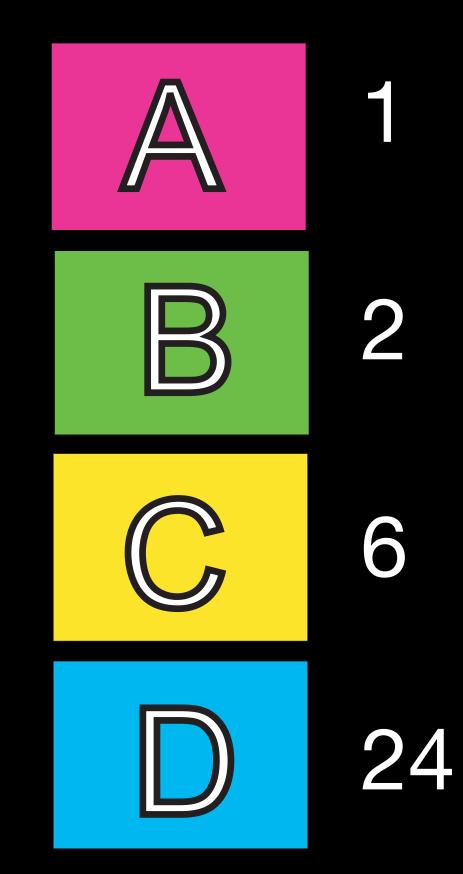

• What does this program print?

```
product = 1
j = 1
while j < 3:
    product = product * j
    j = j + 1
print(product)</pre>
```

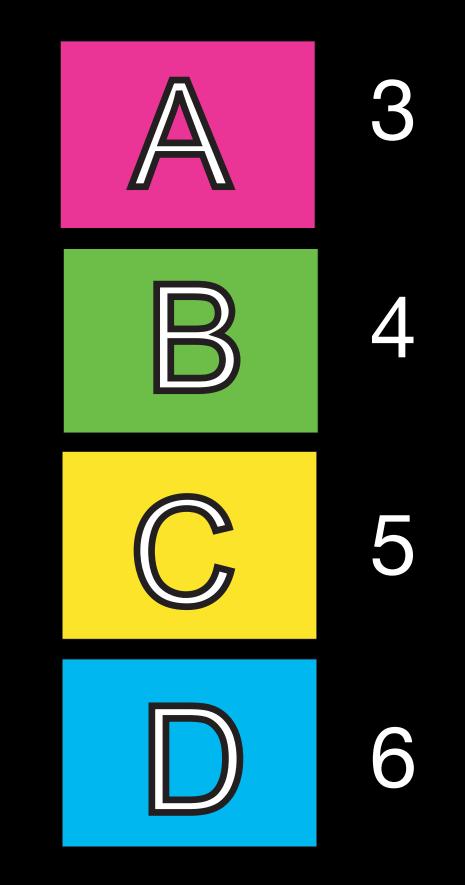

• What does this program print?

```
product = 1
j = 1
while j < 4:
    product = product * j
    j = j + 1
print(product)</pre>
```

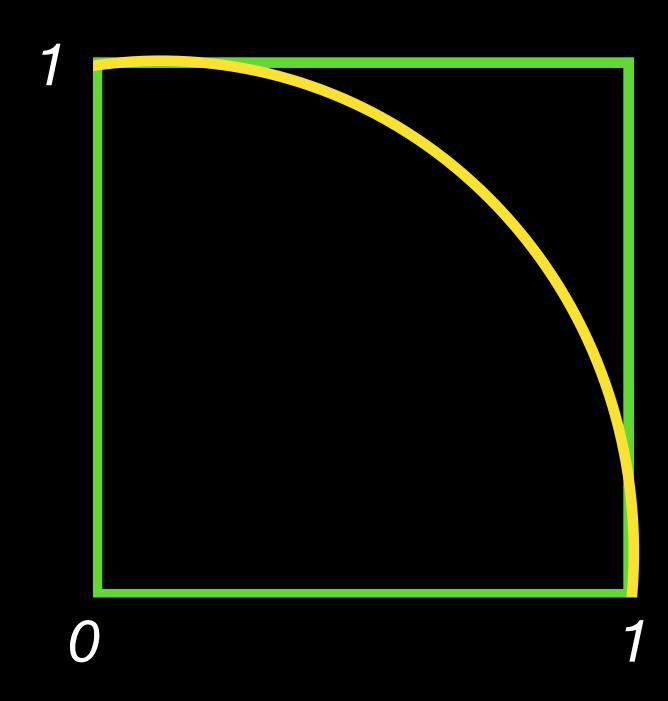

• What value of x makes the program print 24?

product = 1while j < x:</pre> product = product \* j i = i + 1print(product)

- Area of circle?
- Area of square?
- Idea: throw darts in square
  - (circle area) ÷ (square area)  $\approx$  darts in circle  $\div$ darts in square = "hits" / ("hits" + "misses")

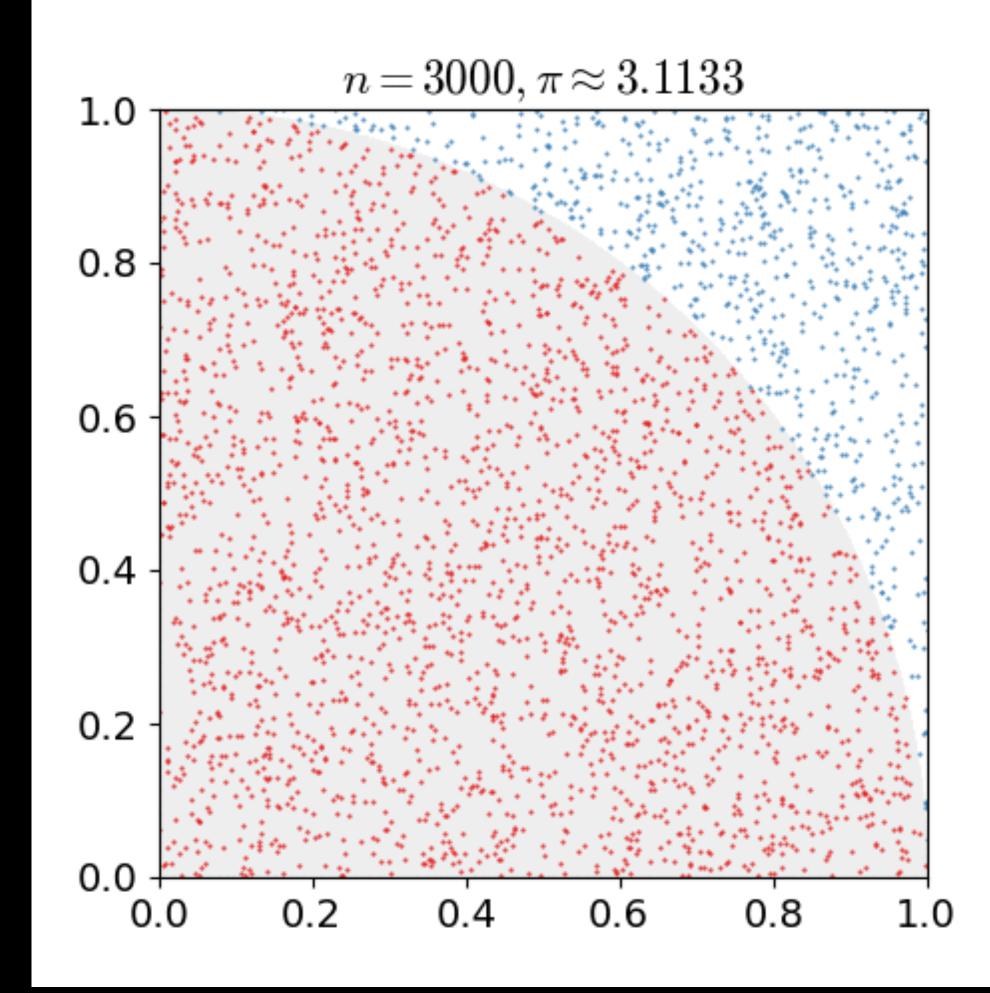

### A silly way to compute π

• Throw darts in square

• (circle area) ÷ (square area)  $\approx$  darts in circle ÷ darts in square =  $\pi/4$ 

### A silly way to compute π

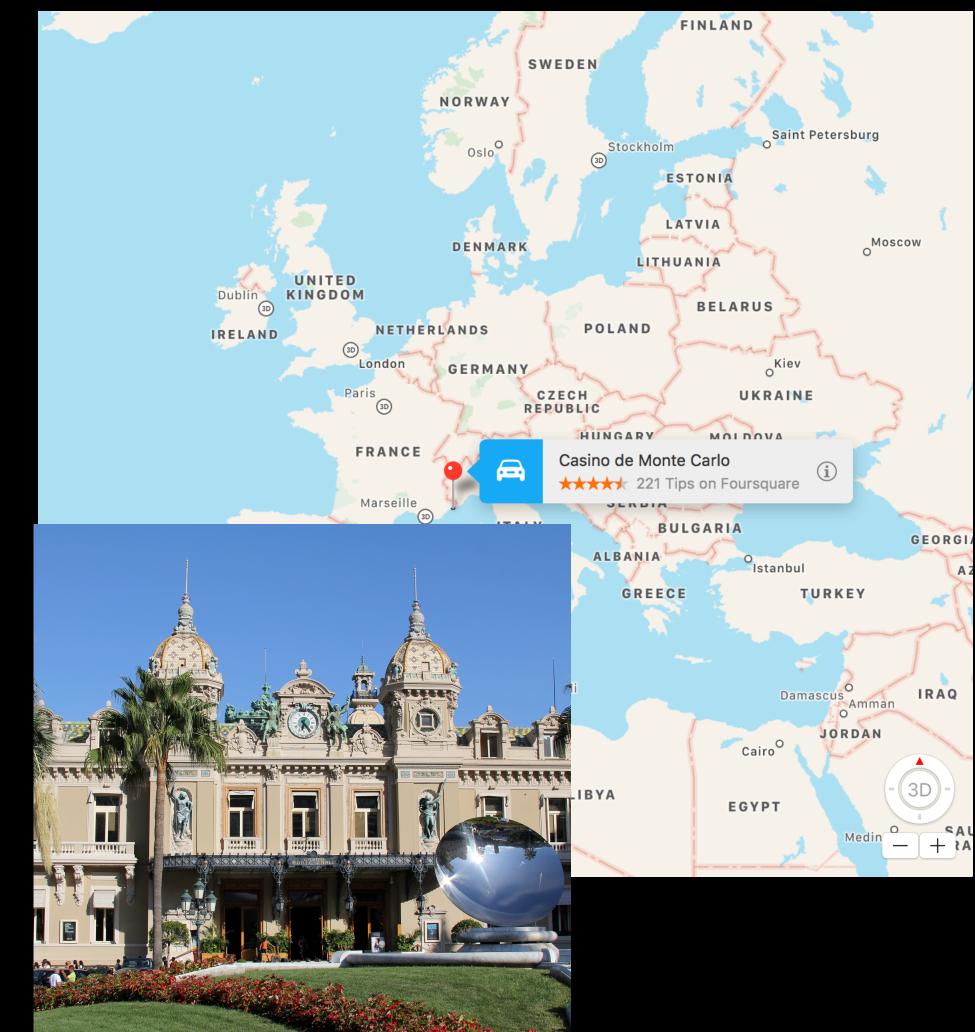

Courtesy wikipedia

## Monte Carlo methods

- This idea might seem silly, but it actually has a lot of uses in physics
- Monte Carlo methods: use repeated random numbers to get results
  - Min/max of functions especially functions of many variables
  - Integrals especially high dimensional
  - Explore probability distributions

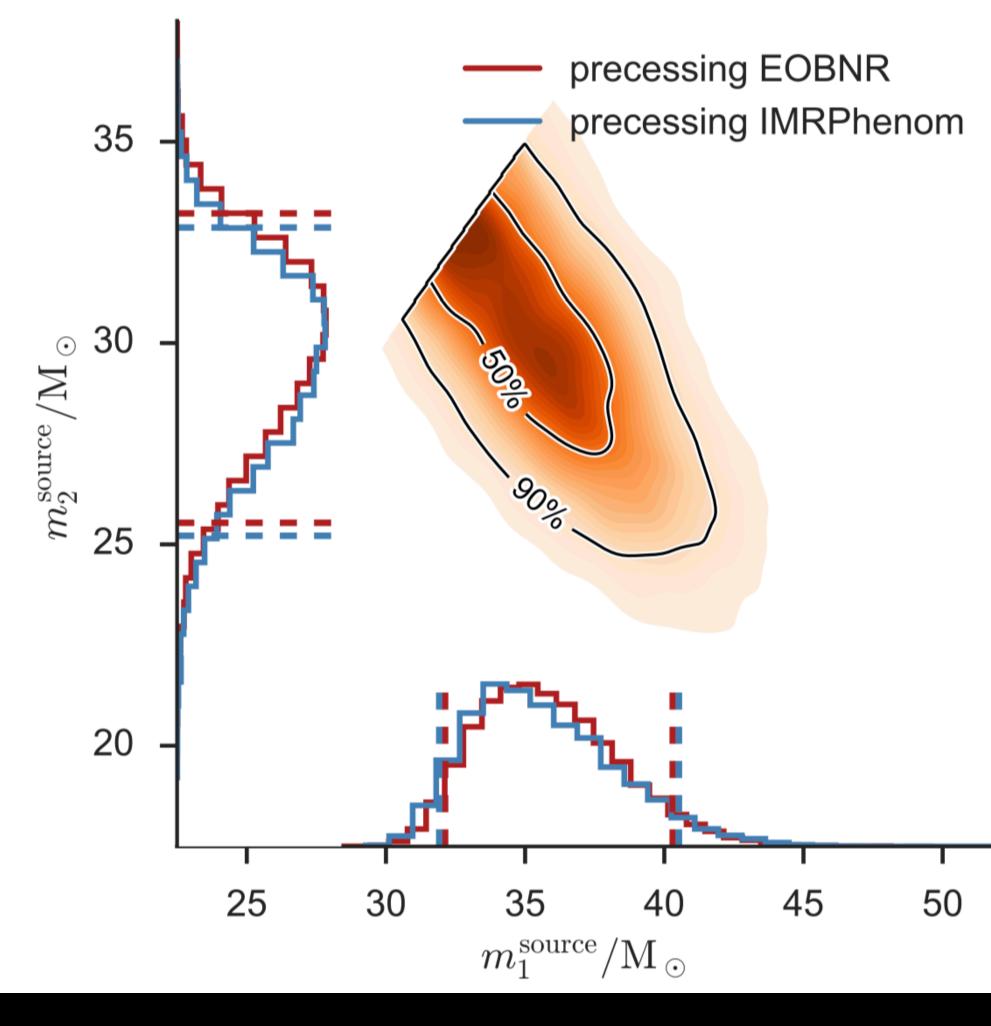

Images courtesy Wikipedia, Apple Maps

### Monte Carlo methods

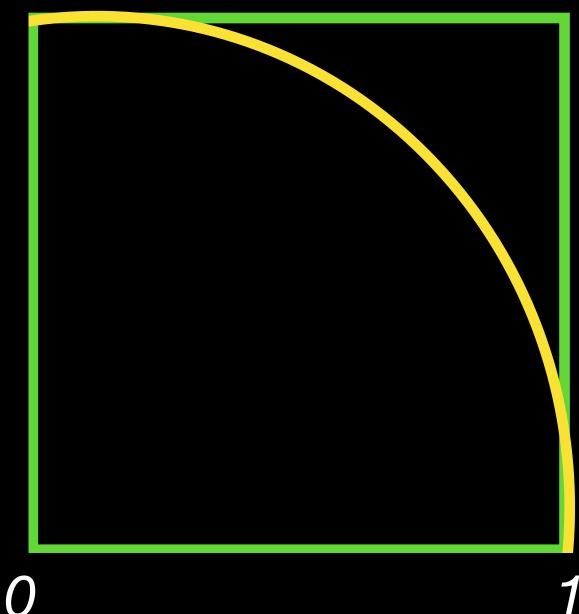

- This idea might seem silly, but it actually has a lot of uses in physics
- When we observe a gravitational wave from merging black holes...
  - What kinds of black holes made the waves?
    - Choose random parameters (masses, spins,
    - Compute the corresponding grav. wave
    - More likely to call the wave a "hit" the better it matches—vs. the last wave "hit"

GW150914: Abbott+ (2016)

### Pi Dartboard 1

### • Write a program that prints one random number between 0 and 1

### import math **import** random

print(random.random())

### Pi Dartboard 2

- Challenge: Modify your program
  - Store the random number in a variable x
  - Store a second random number in a variable y
  - Print x and y

#### import math import random

print(random.random())

()

## Pi Dartboard 2 Solution

- Challenge: Modify your program
  - Store the random number in a variable x
  - Store a second random number in a variable y
  - Print x and y

import math **import** random

x = random.random() y = random.random()

()

print(x) print(y)

### Pi Dartboard 3

- Challenge: Modify your program
  - Print x<sup>2</sup> + y<sup>2</sup> instead of just x and y

()

### import math **import** random

x = random.random()

y = random.random()

#### print(x) print(y)

### Pi Dartboard 3

- Challenge: Modify your program
  - Compute  $x^2 + y^2$  and store it in a variable rSquared
  - Print rSquared instead of just x and y

### import math **import** random

x = random.random()

()

y = random.random()

#### print(x) print(y)

### Pi Dartboard 3 Solution

- Challenge: Modify your program
  - Compute  $x^2 + y^2$  and store it in a variable rSquared
  - Print rSquared instead of just x and y

### import math import random

x = random.random()y = random.random()

()

 $rSquared = x^{**}2 + y^{**}2$ print(rSquared)

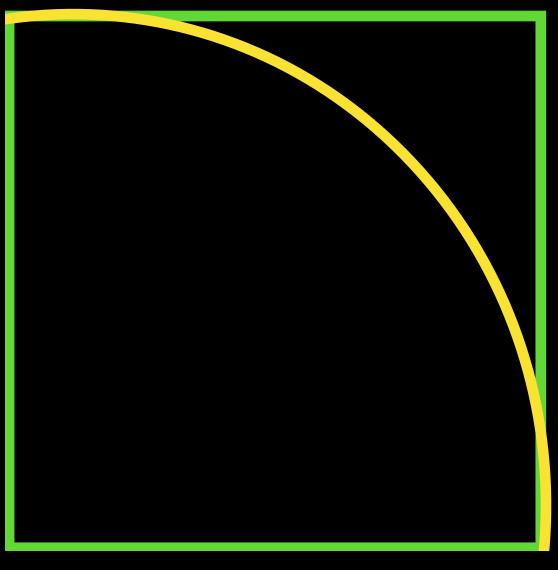

• Which could be a number the program prints?

import math import random x = random.random() y = random.random() rSquared = x\*\*2 + y\*\*2 print(rSquared)

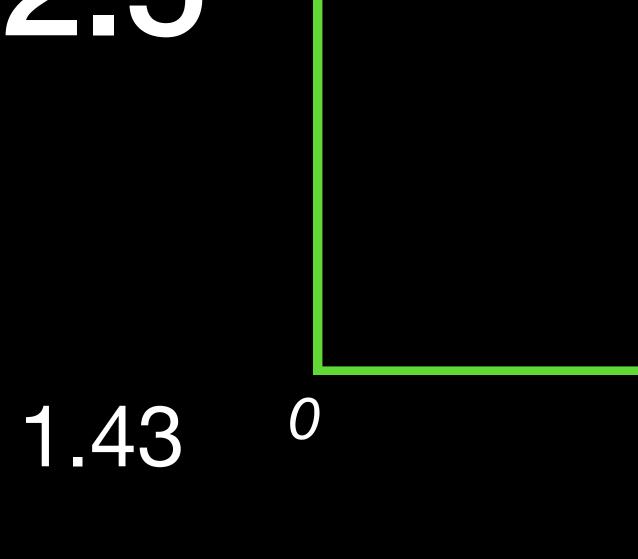

0

### Clicker question #2.5 • If the dart is inside the circle,

which could be the number printed by the program?

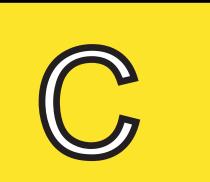

import math **import** random x = random.random()y = random.random()  $rSquared = x^{**2} + y^{**2}$ print(rSquared)

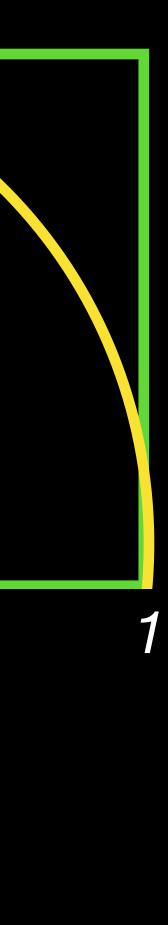

0.99

1.01

More than one of ABC

### Pi Dartooard 4

- Challenge: Modify your program
  - Just below import random, make a new variable called "hits", set to 0
  - If rSquared < 1, add 1 to hits
  - Print hits instead of rSquared

### import math import random

x = random.random()y = random.random()

()

 $rSquared = x^{**2} + y^{**2}$ print(rSquared)

## Pi Dartboard 4 Solution

- Challenge: Modify your program
  - Just below import random, make a new variable called "hits", set to 0
  - If rSquared < 1, add 1 to hits
  - Print hits instead of rSquared

import math 0 import random

hits = 0

x = random.random()

y = random.random()

 $rSquared = x^{**2} + y^{**2}$ if rSquared < 1: hits = hits + 1print(hits)

### Pi Dartboard 5

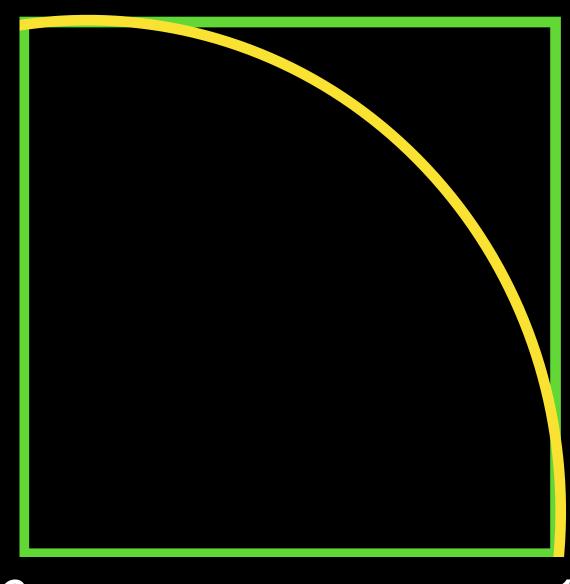

- Challenge: Modify your program
  - Add a new variable, just below hits, called throws. Set it equal to 10.
  - Put the code that throws the dart and sees if it hit inside a while loop, so that you throw 10 darts instead of 1 dart
  - Don't forget to increment your while loop counter variable (i or j or whatever)

### import math import random

hits = 0

x = random.random() y = random.random()

rSquared = x\*\*2 + y\*\*2
if rSquared < 1:
 hits = hits + 1
print(hits)</pre>

0

# Pi Dartboard 5 Solution

- Challenge: Modify your program
  - Add a new variable, just below hits, called throws. Set it equal to 10.
  - Put the code that throws the dart and sees if it hit inside a while loop, so that you throw 10 darts instead of 1 dart

- hits = 0throws = 10
- i = Ø

#### **import** math **import** random

while i < throws: x = random.random()y = random.random() ()

 $rSquared = x^{**2} + y^{**2}$ if rSquared < 1: hits = hits + 1i = i + 1print(hits)

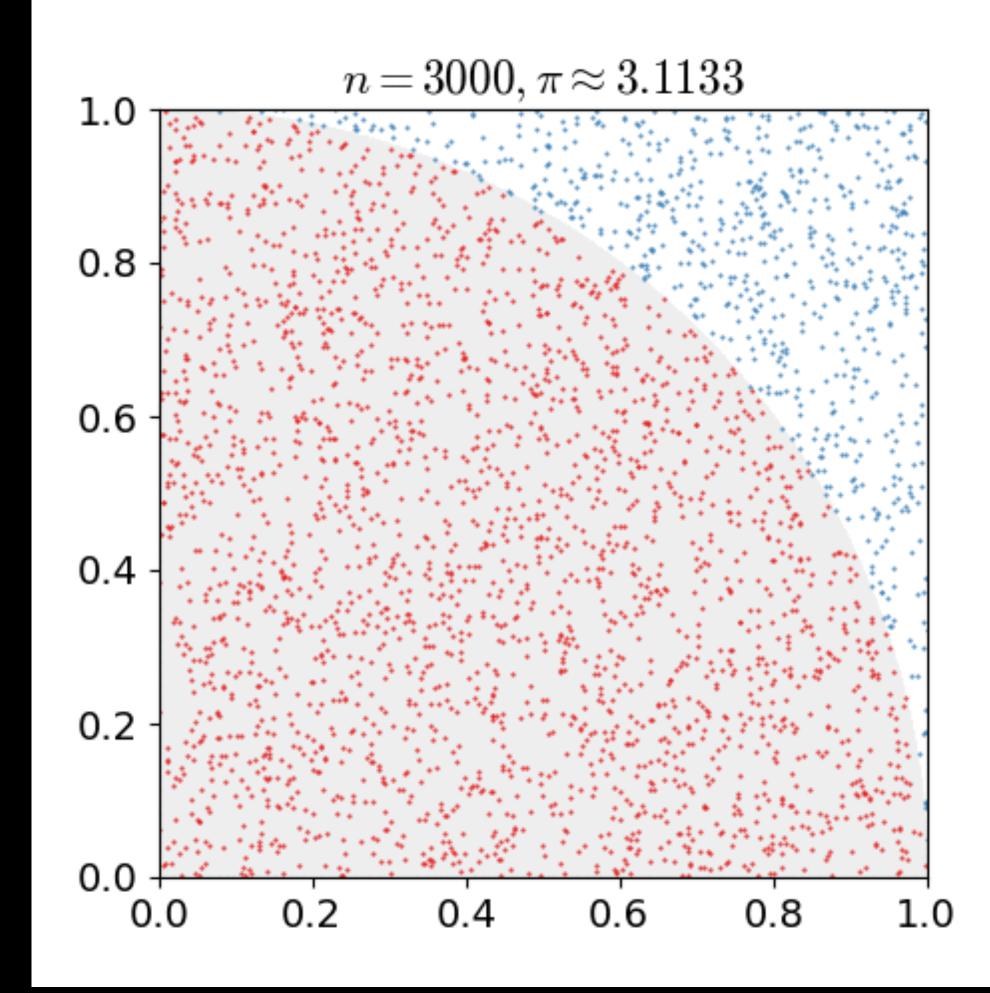

Throw darts in square

• (circle area) ÷ (square area)  $\approx$  hits  $\div$  throws =  $\pi/4$ 

• So  $\pi \approx 4 *$  (hits  $\div$  throws)

### A silly way to compute π

Courtesy wikipedia

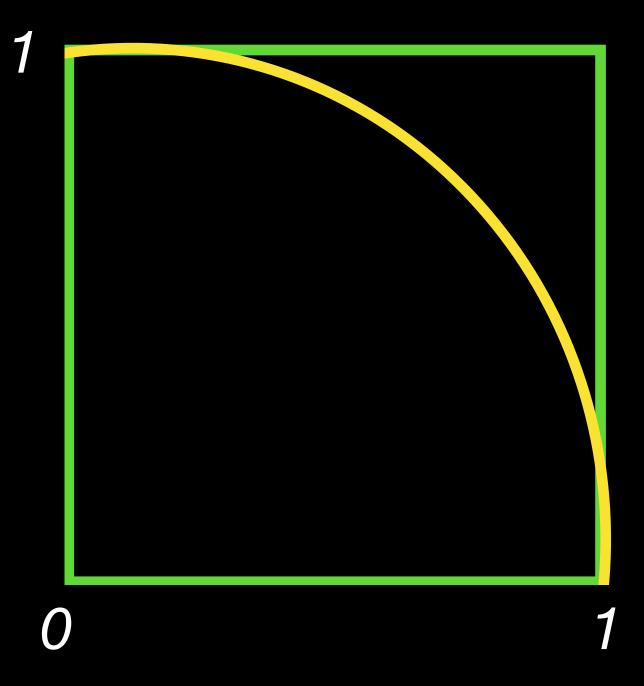

### Finish the dartboard

- Compute pi as 4.0 \* float(hits) / float(throws)
- Print your pi estimate

Pi Dartboard 6 import math **import** random hits = 0 throws = 10i = Ø while i < throws:</pre> x = random.random()y = random.random() $rSquared = x^{**2} + y^{**2}$ if rSquared < 1: hits = hits + 1i = i + 1

### print(hits)

### Pi Dartboard 6 Solution **import** math **import** random hits = 0 throws = 10

- Finish the dartboard
  - Compute pi as 4.0 \* float(hits) / float(throws)
  - Print your pi estimate

- = 0i = i + 1
- print(pi)

while i < throws:</pre> x = random.random()y = random.random()

 $rSquared = x^{**2} + y^{**2}$ if rSquared < 1: hits = hits + 1

pi = 4.0 \* float(hits) / float(throws)

O

- The tutor won't let us run lots of darts
- So paste this into a cell in Jupyter on <u>colab.google.com</u> and run it
  - See what happens as you make throws 10\*\*n, n=1,2,3,4,5,6,7

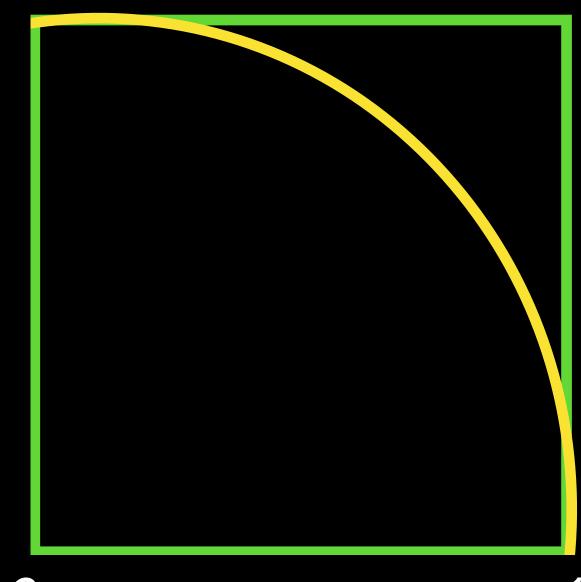

**import** math hits = 0 throws = 10= 0i = i + 1

# Pi Dartboard 7 **import** random

while i < throws:</pre> x = random.random()y = random.random()

 $rSquared = x^{**2} + y^{**2}$ if rSquared < 1: hits = hits + 1

pi = 4.0 \* float(hits) / float(throws) print(pi)

()
