

Day 2

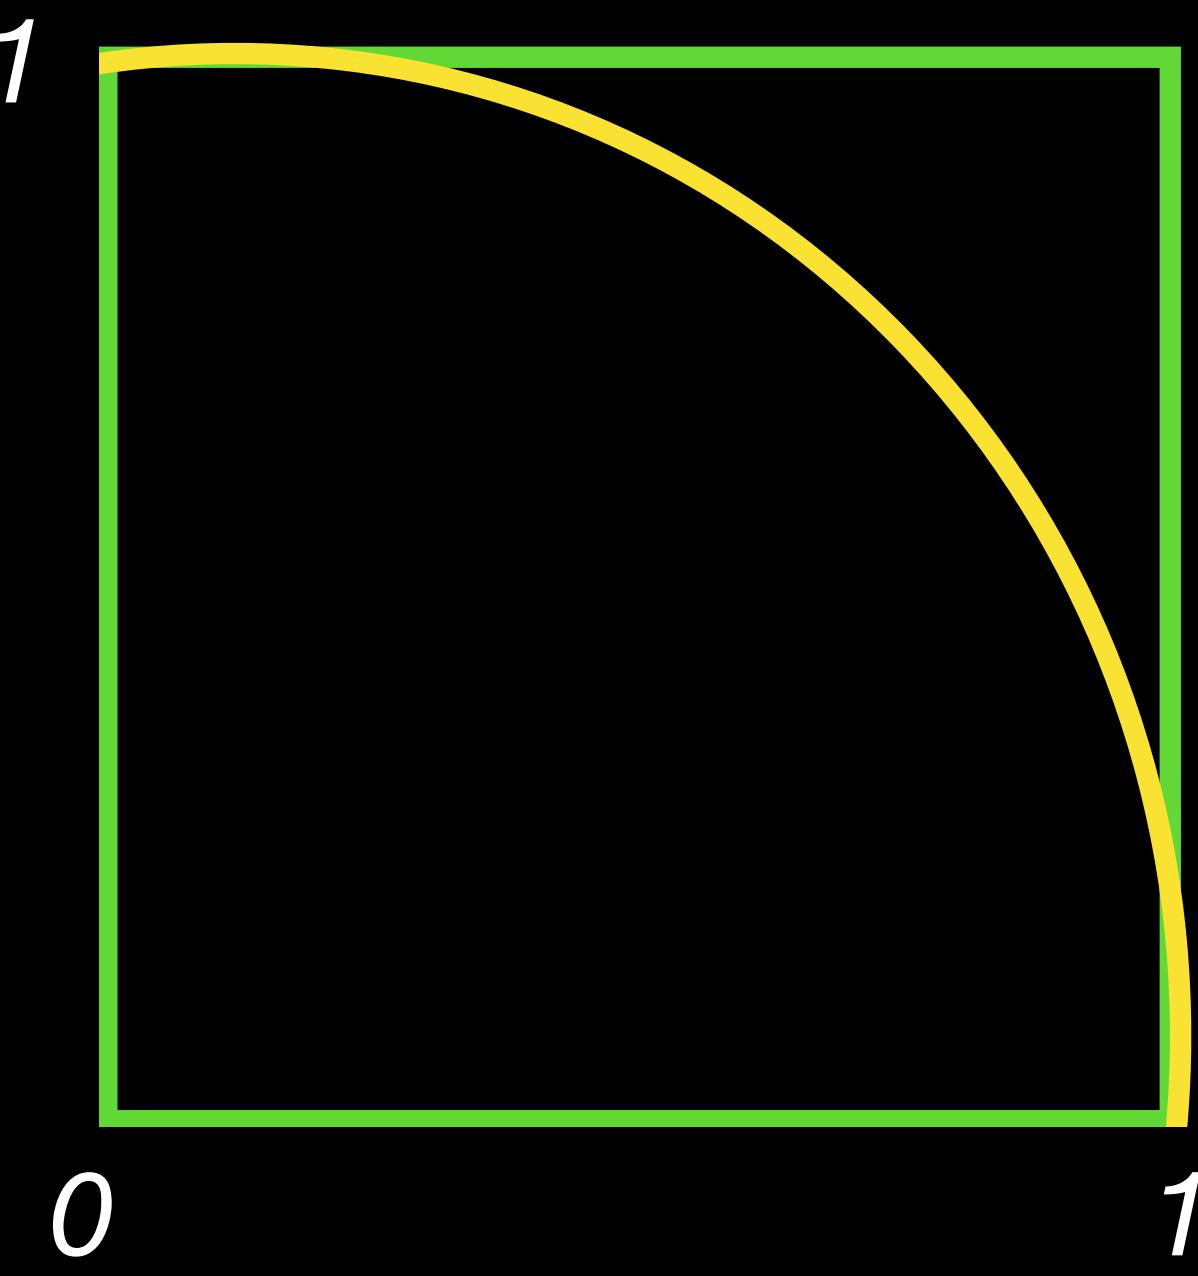

- First numerical calculation: computing π
- More python: numpy & matplotlib, functions
- Resolution, precision, accuracy
- Unix
- Parallel computing

Course web page

- <https://geoffrey-lovelace.com/Workshop/2022>
- Cheat sheets for python & unix
- Links to places where you can run python notebooks for free
- Slides from the workshop

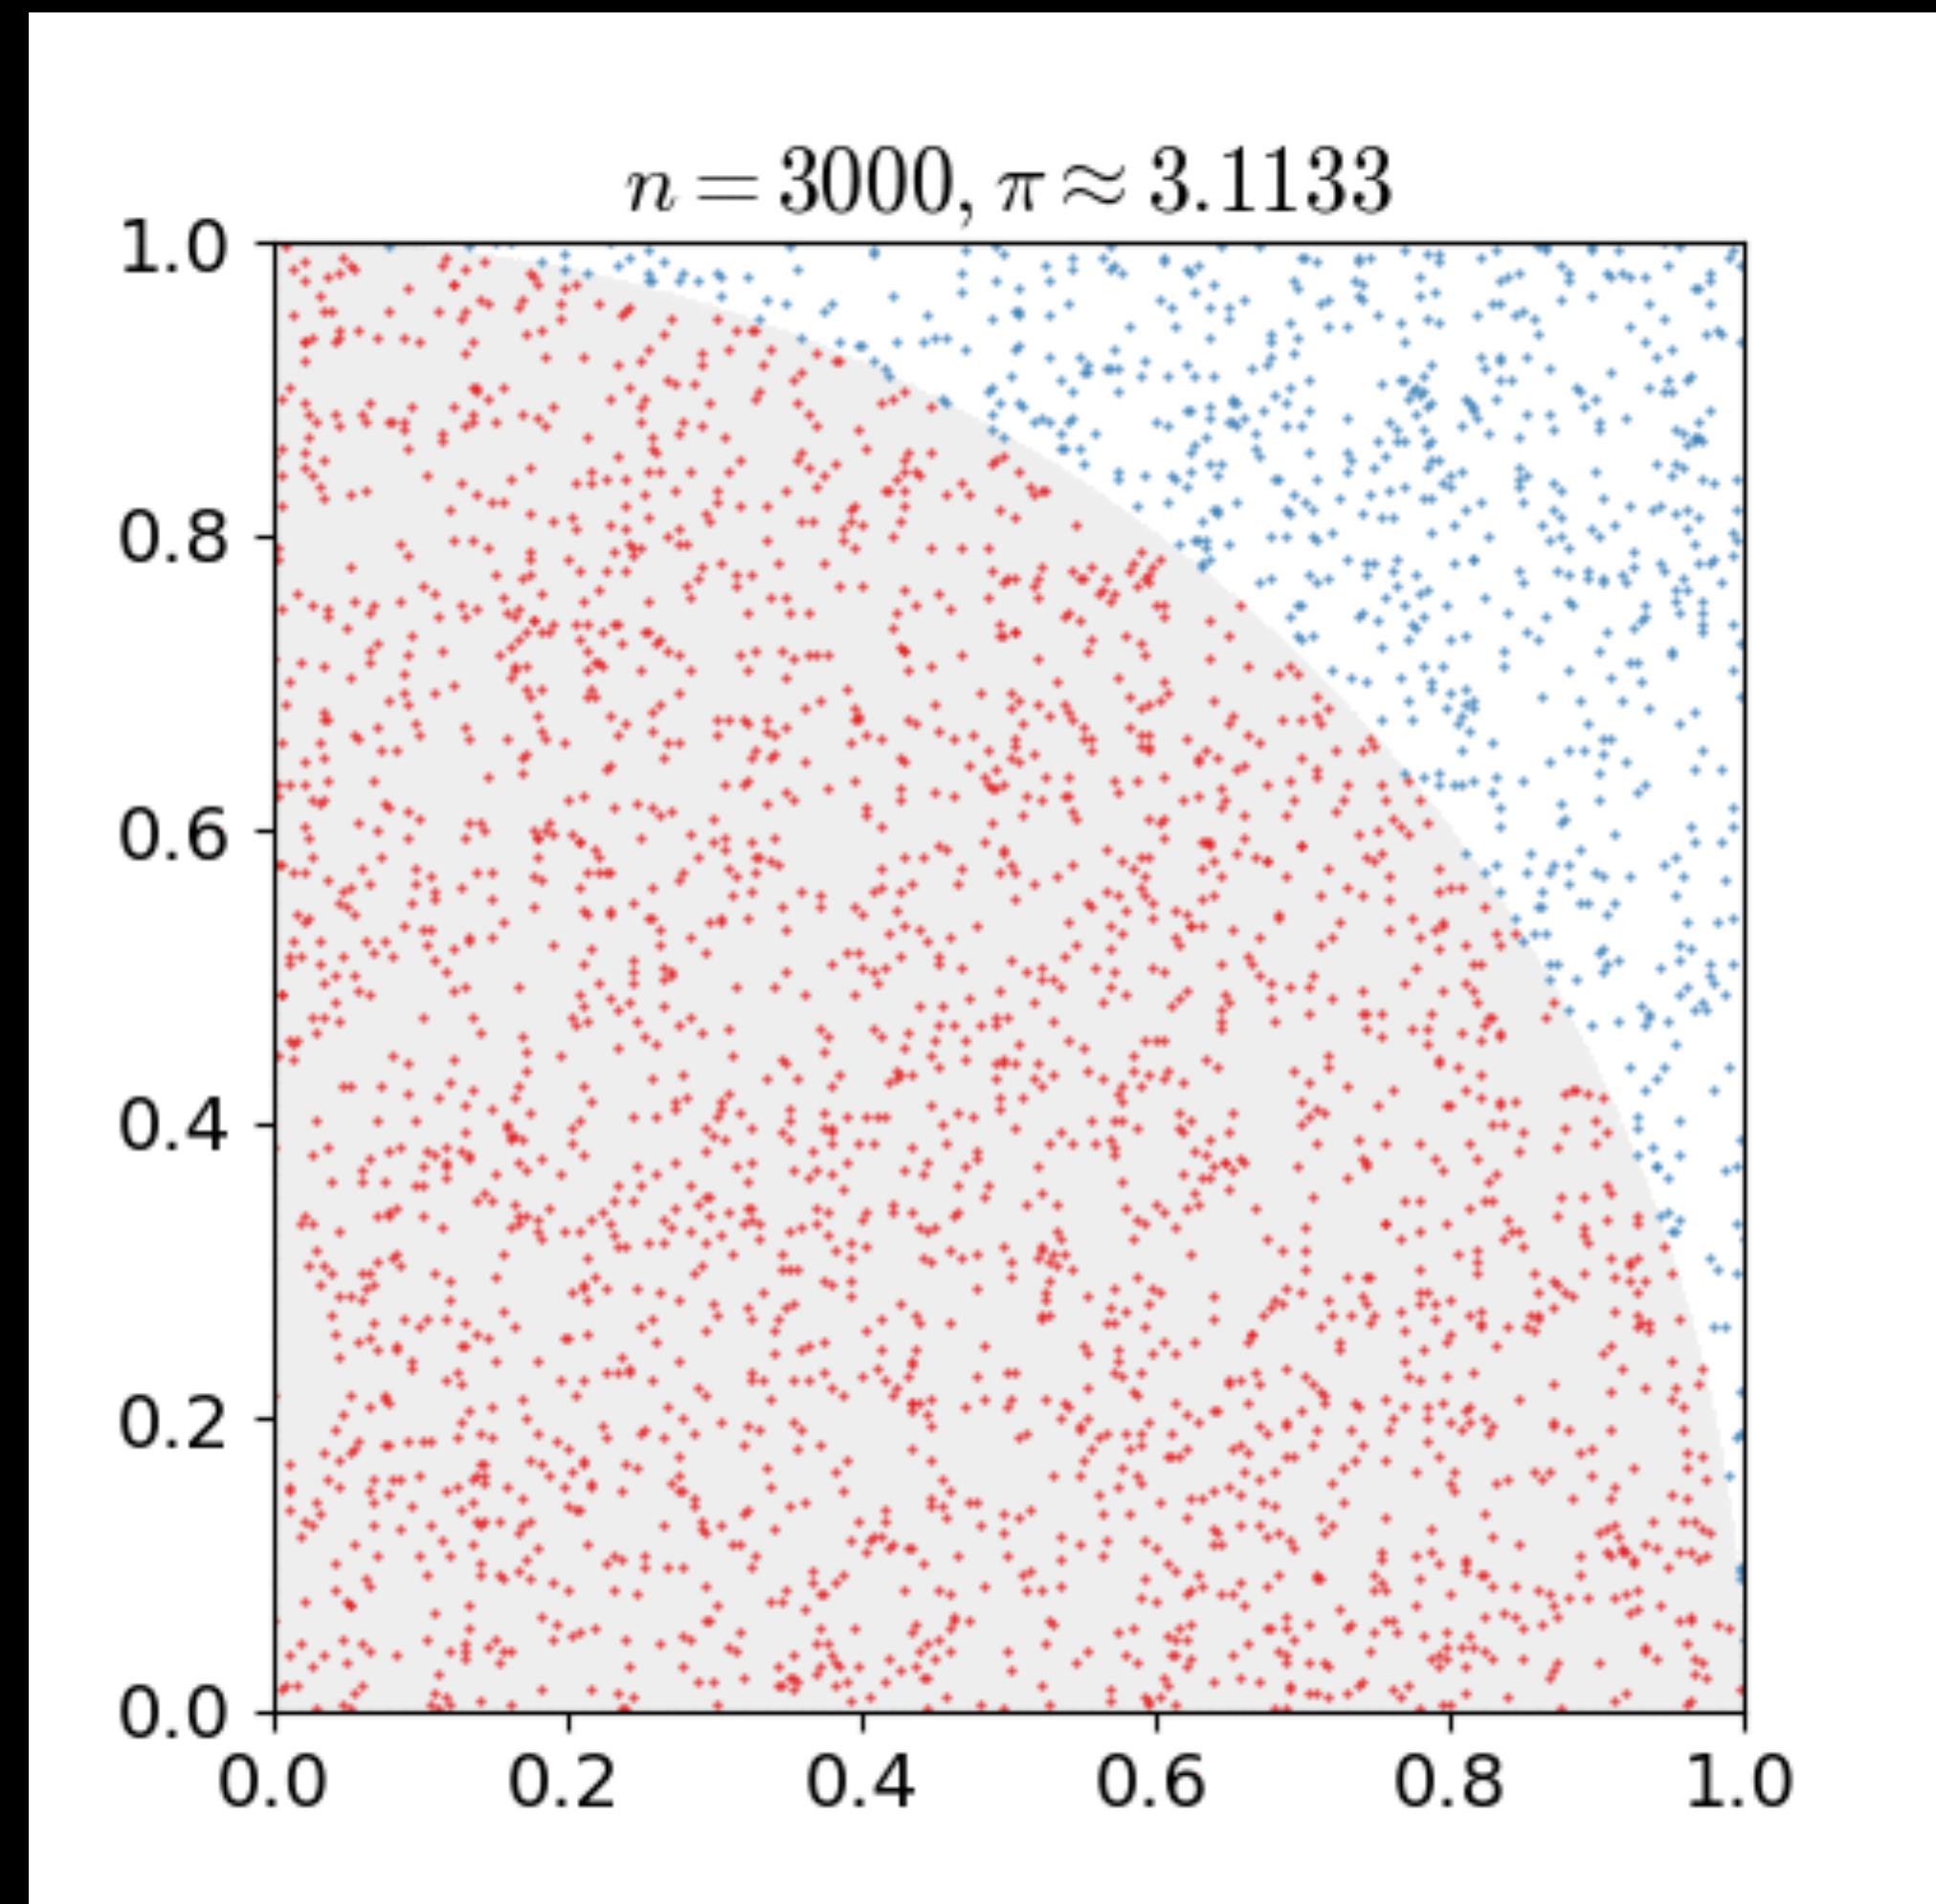

A silly way to compute π

- Area of circle?
- Area of square?
- Idea: throw darts in square
 - $(\text{circle area}) \div (\text{square area}) \approx \text{darts in circle} \div \text{darts in square} = \text{"hits" / ("hits" + "misses")}$

A silly way to compute π

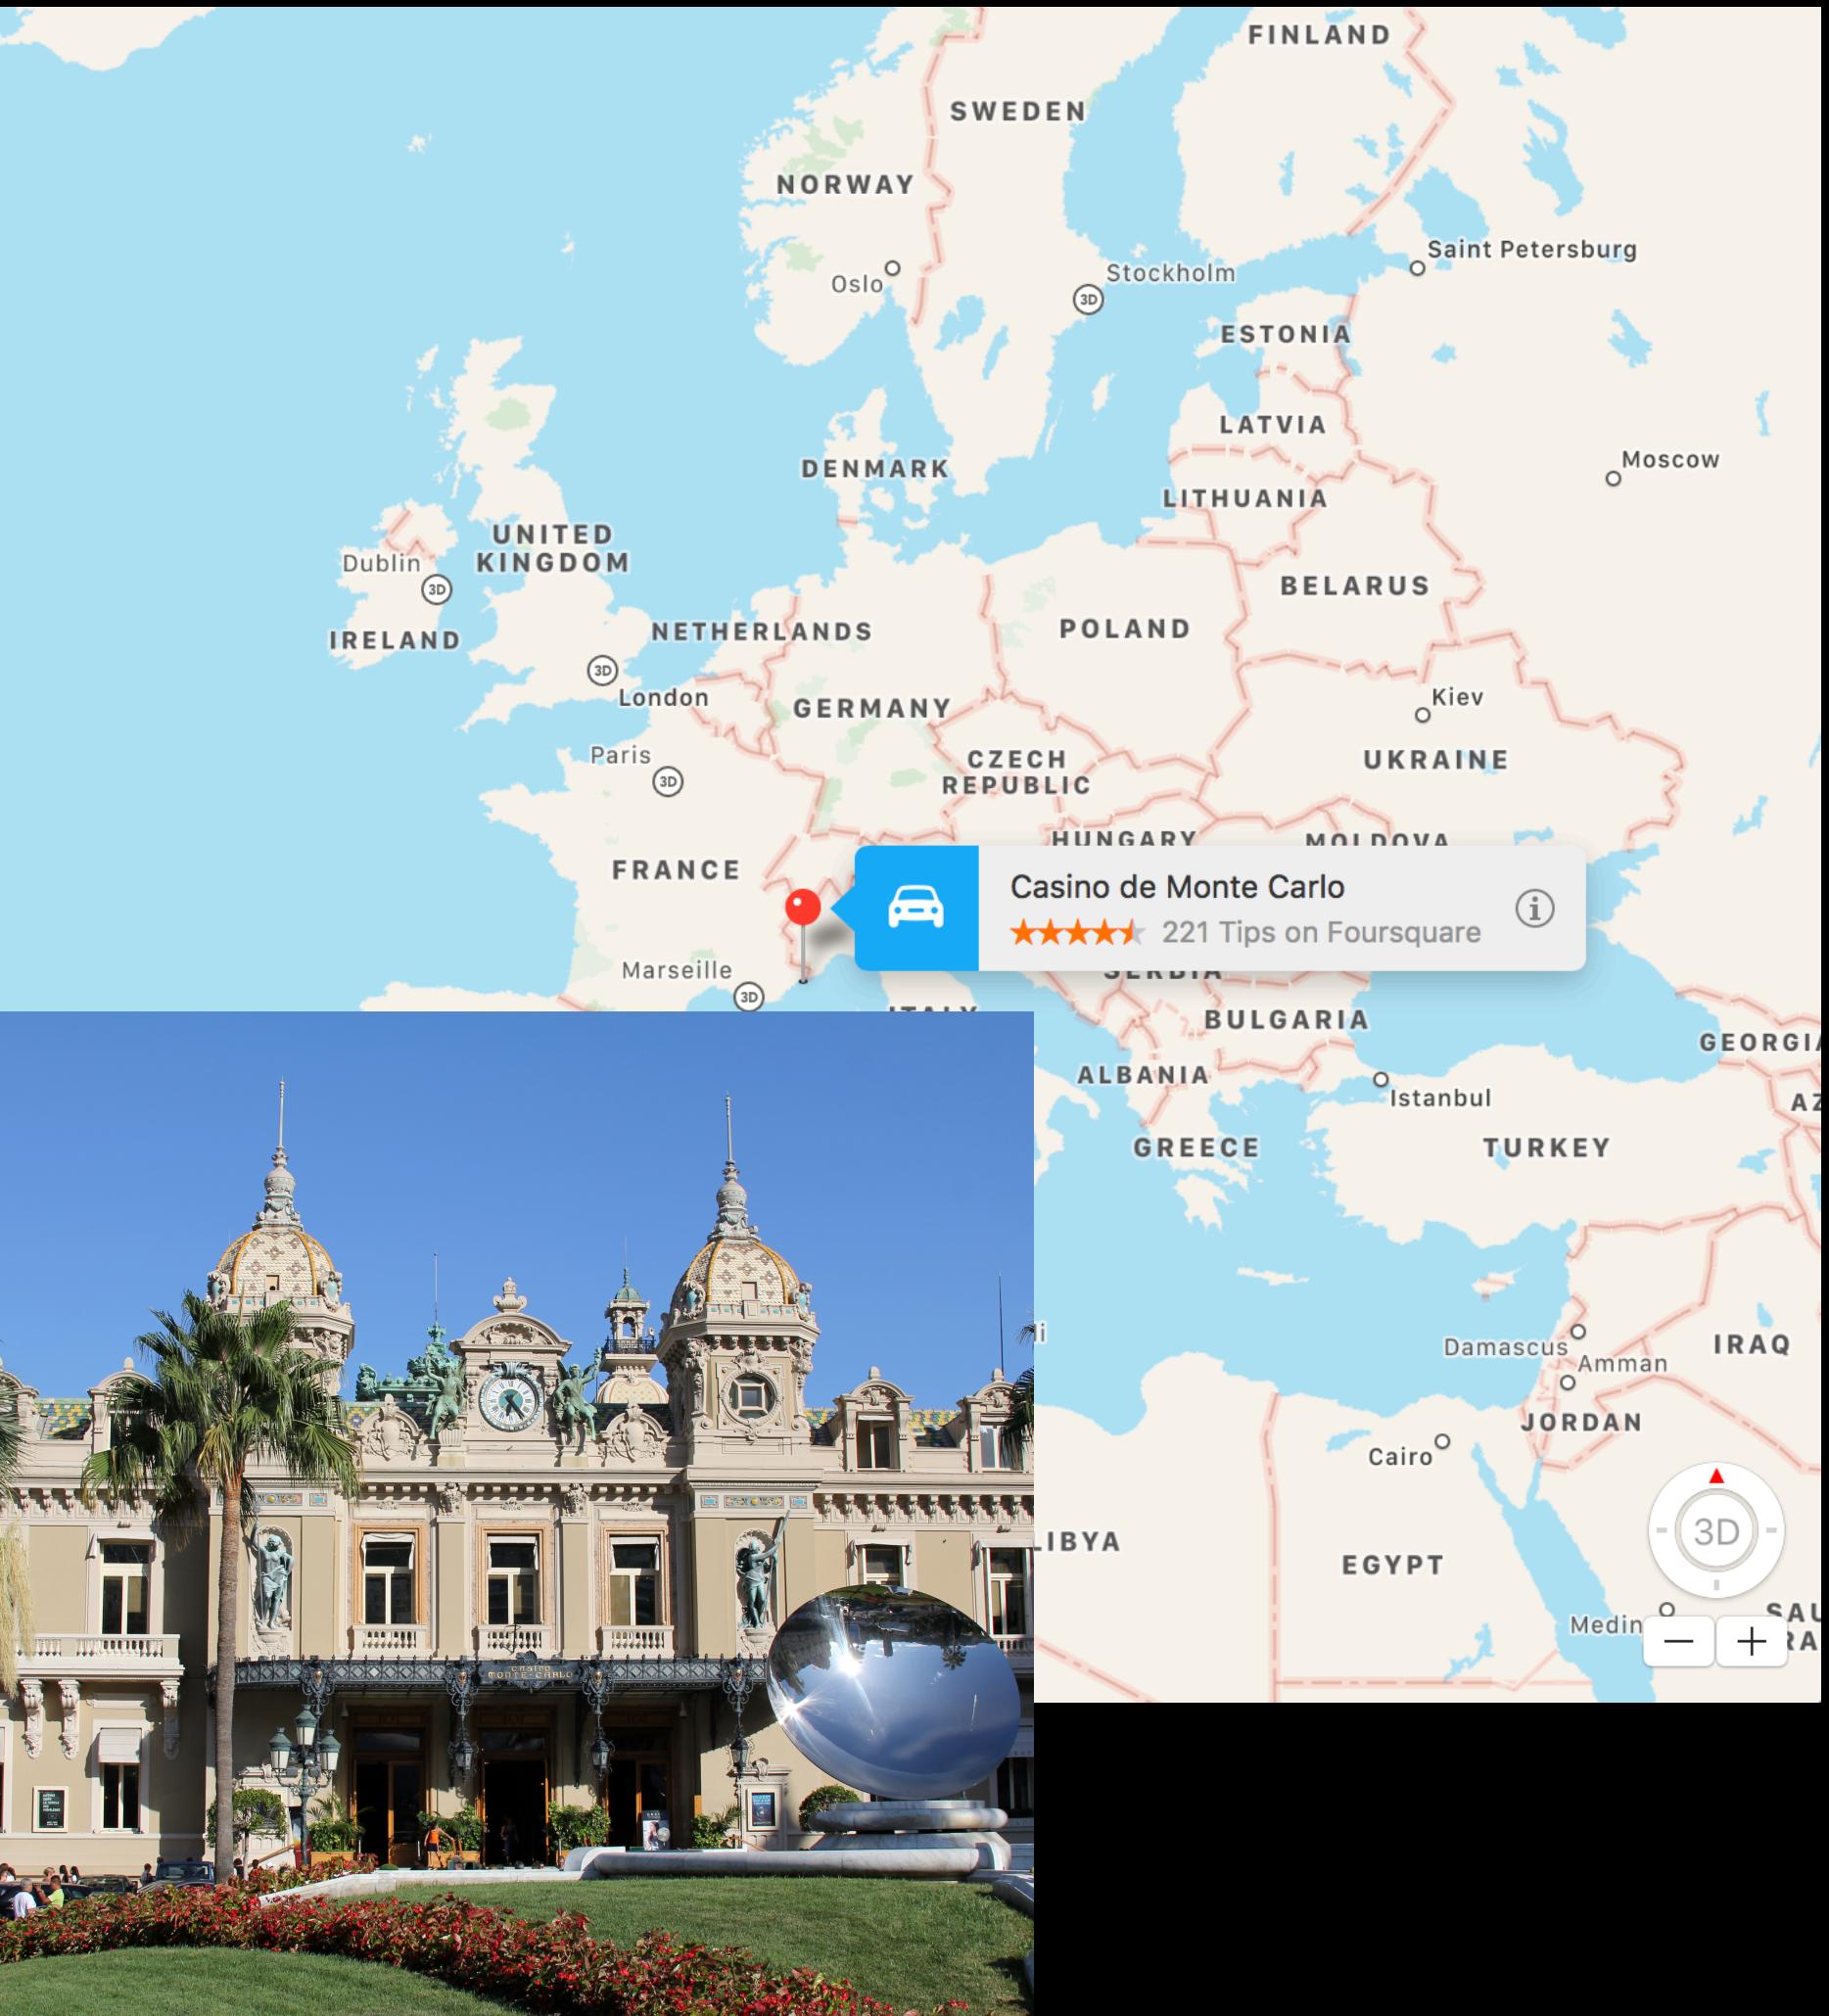

- Throw darts in square
 - $(\text{circle area}) \div (\text{square area}) \approx \text{darts in circle} \div \text{darts in square} = \pi/4$

Courtesy wikipedia

Monte Carlo methods

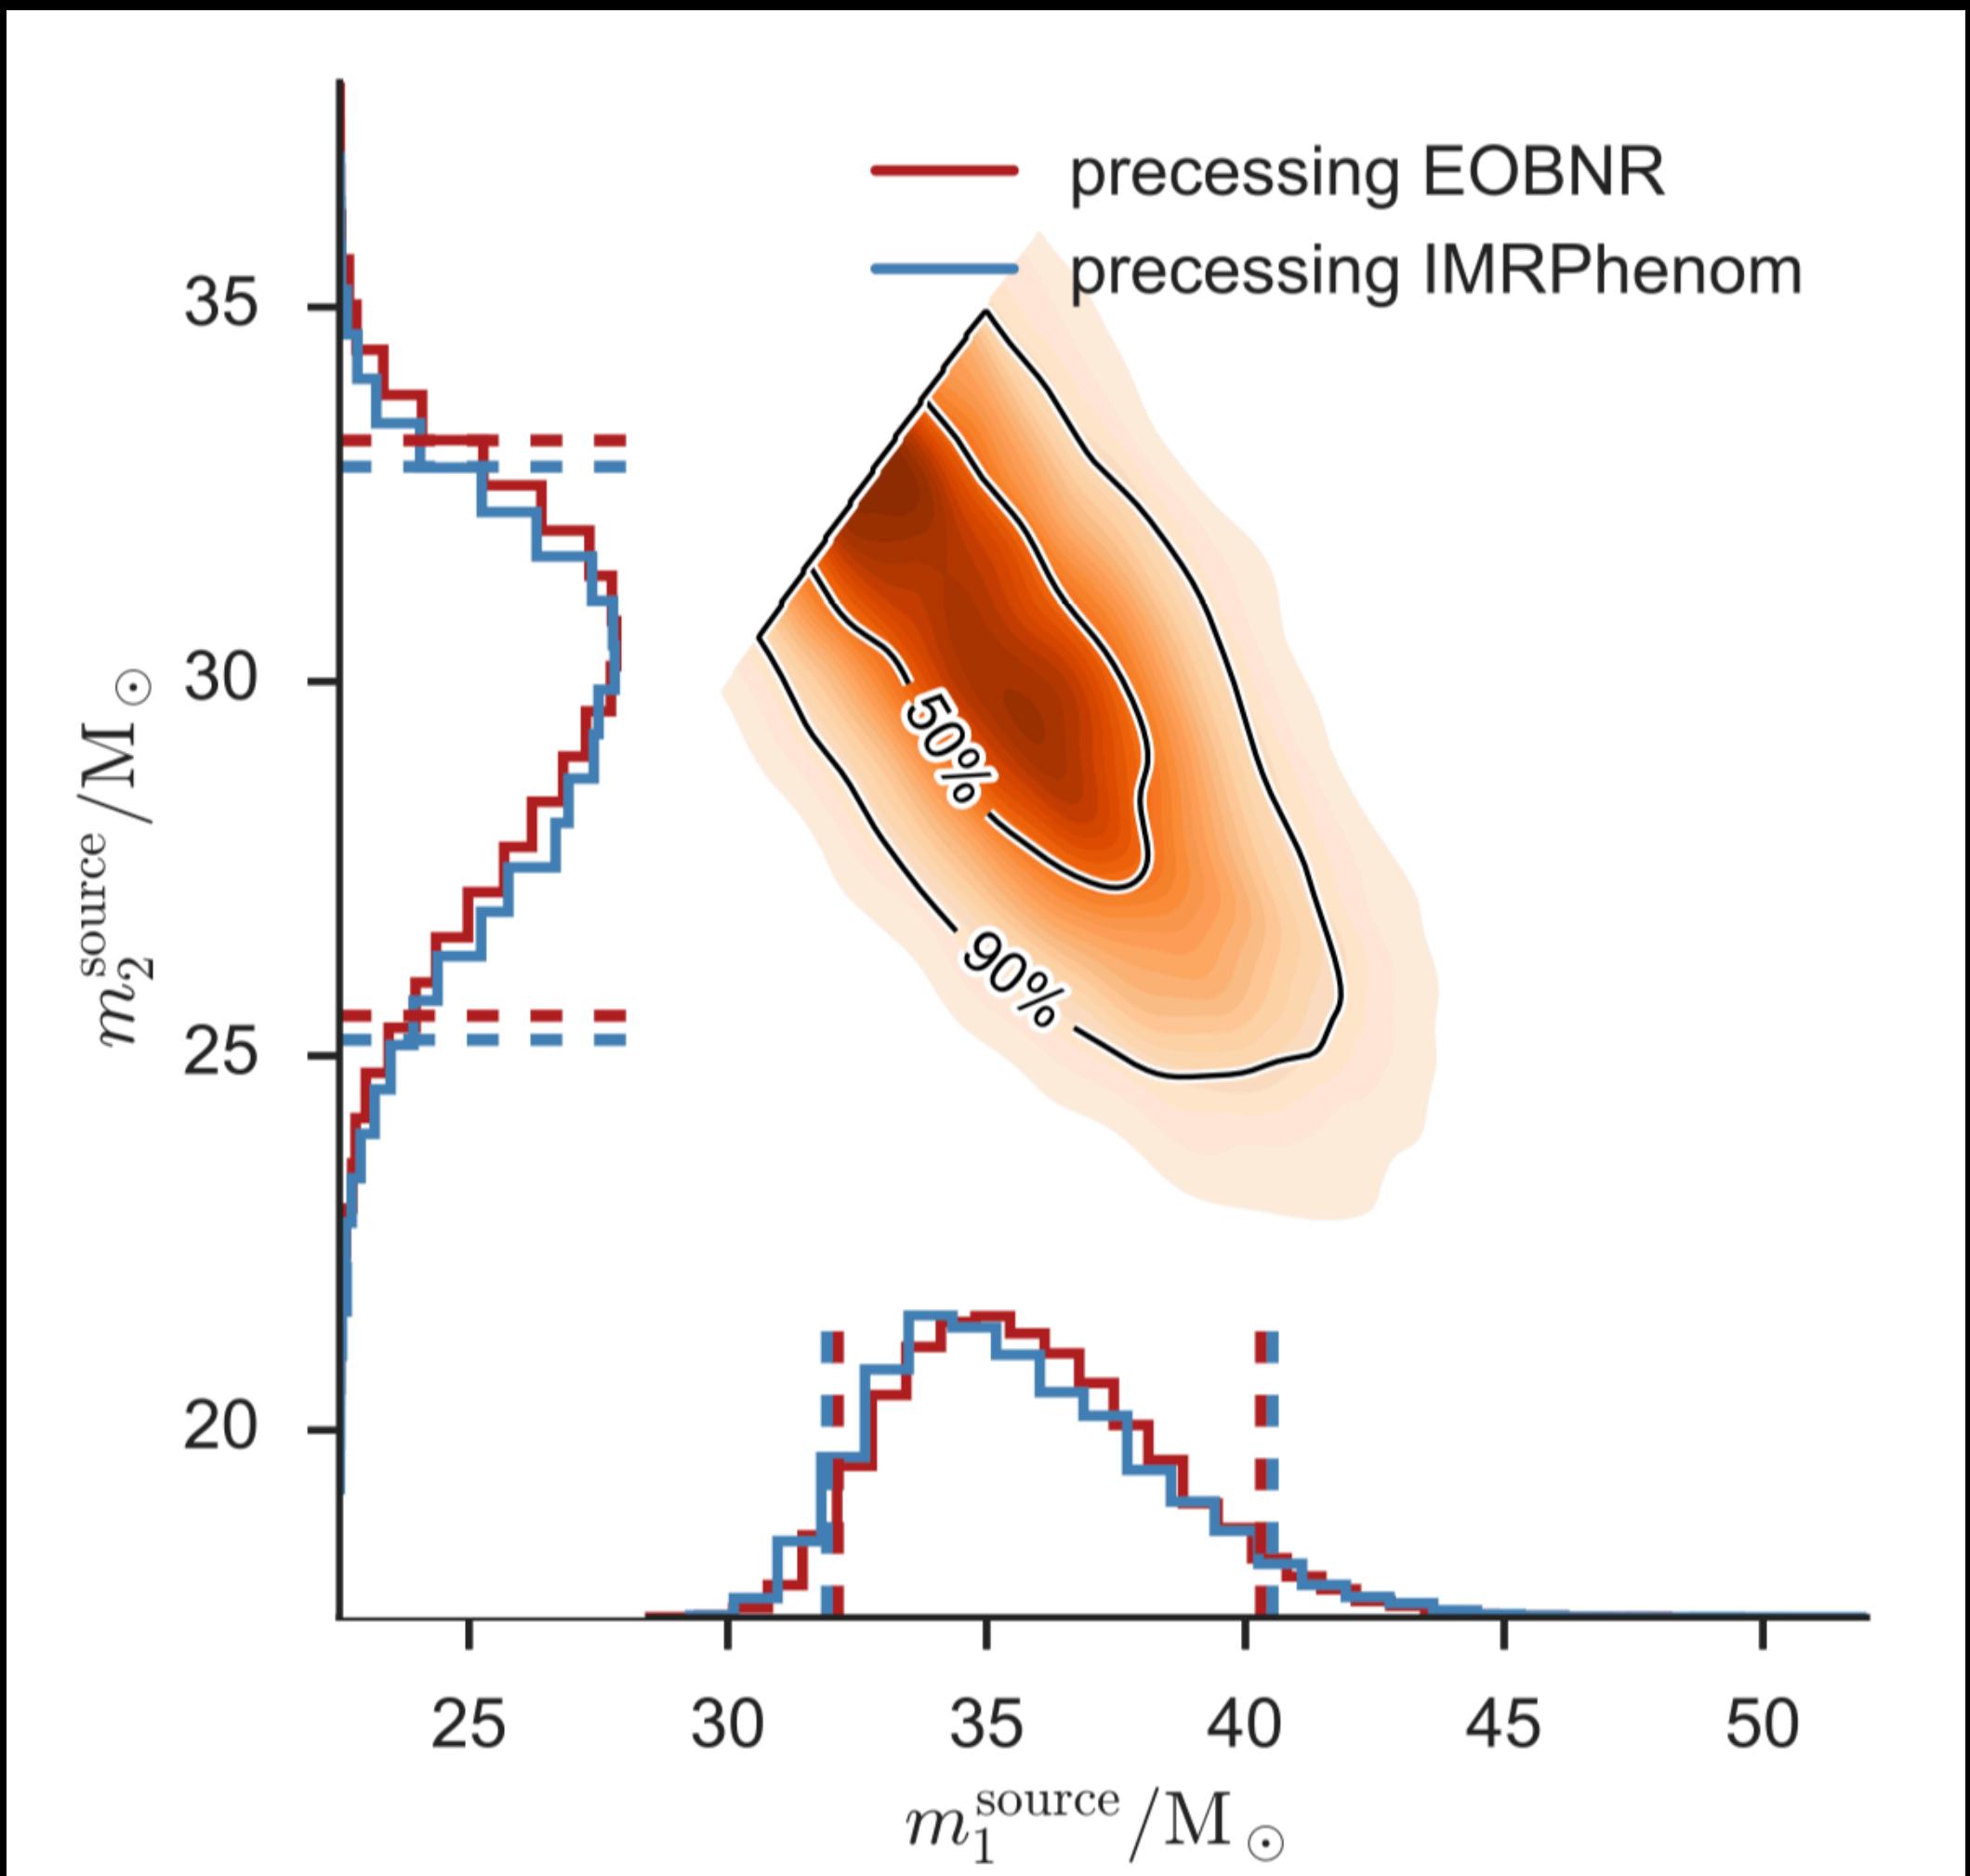

- This idea might seem silly, but it actually has a lot of uses in physics
- **Monte Carlo methods: use repeated random numbers to get results**
- Min/max of functions
especially functions of many variables
- Integrals
especially high dimensional
- Explore probability distributions

Images courtesy Wikipedia, Apple Maps

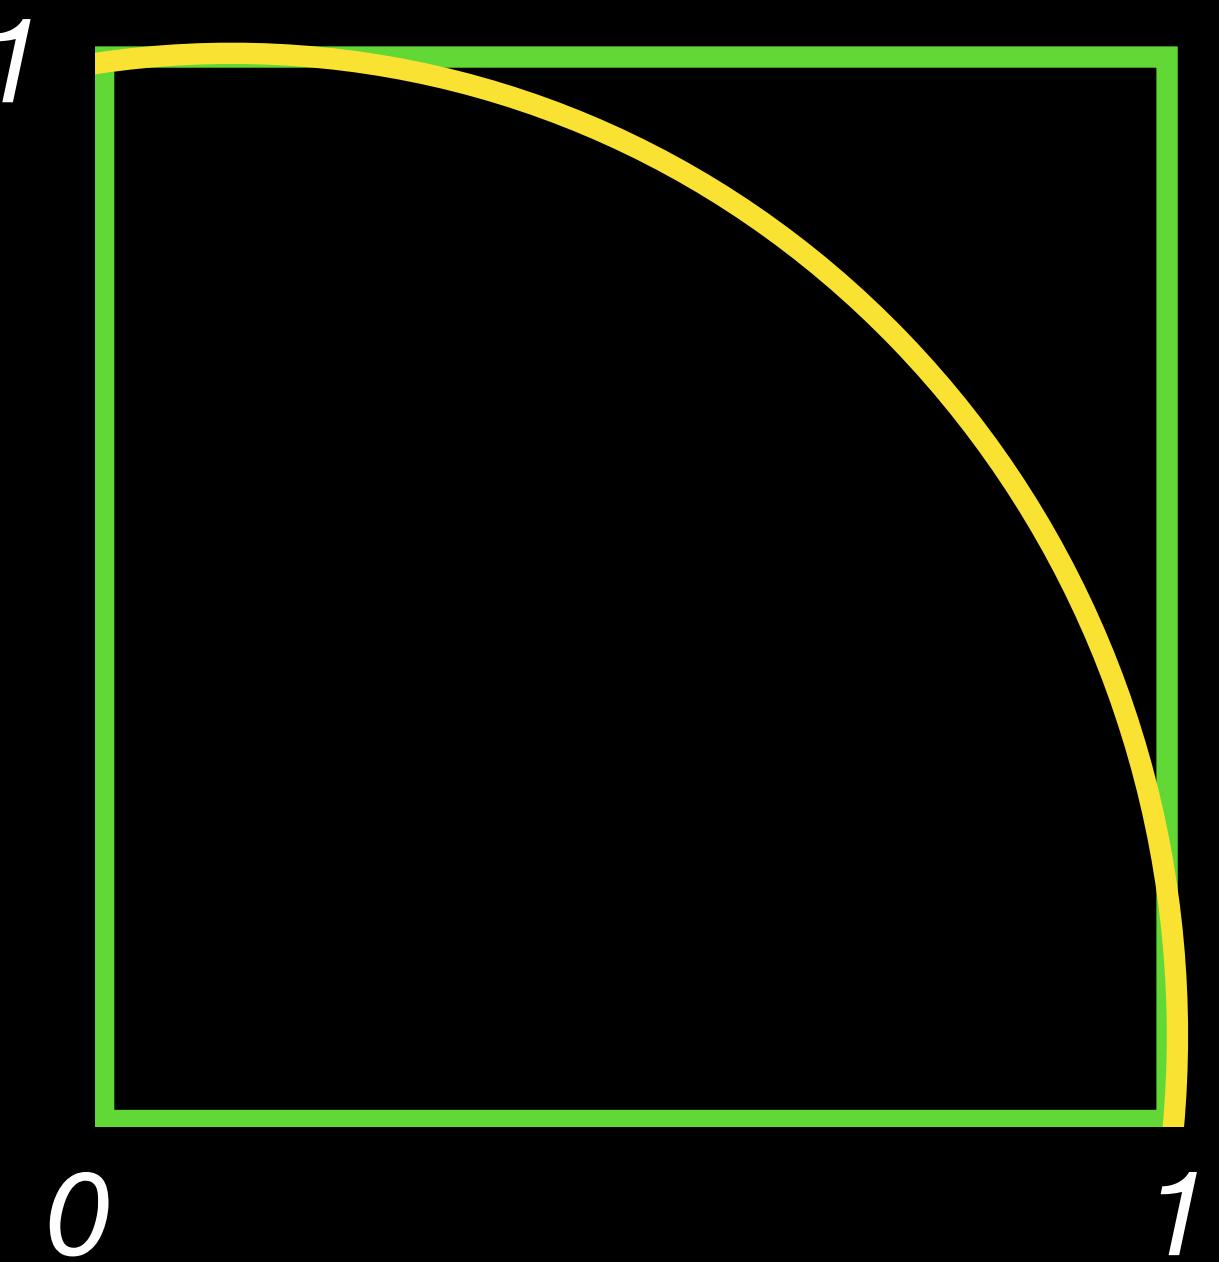

Monte Carlo methods

- This idea might seem silly, but it actually has a lot of uses in physics
- When we observe a gravitational wave from merging black holes...
 - What kinds of black holes made the waves?
 - Choose random parameters (masses, spins, ...)
 - Compute the corresponding grav. wave
 - More likely to call the wave a “hit” the better it matches—vs. the last wave “hit”

GW150914: Abbott+ (2016)

Pi Dartboard 1

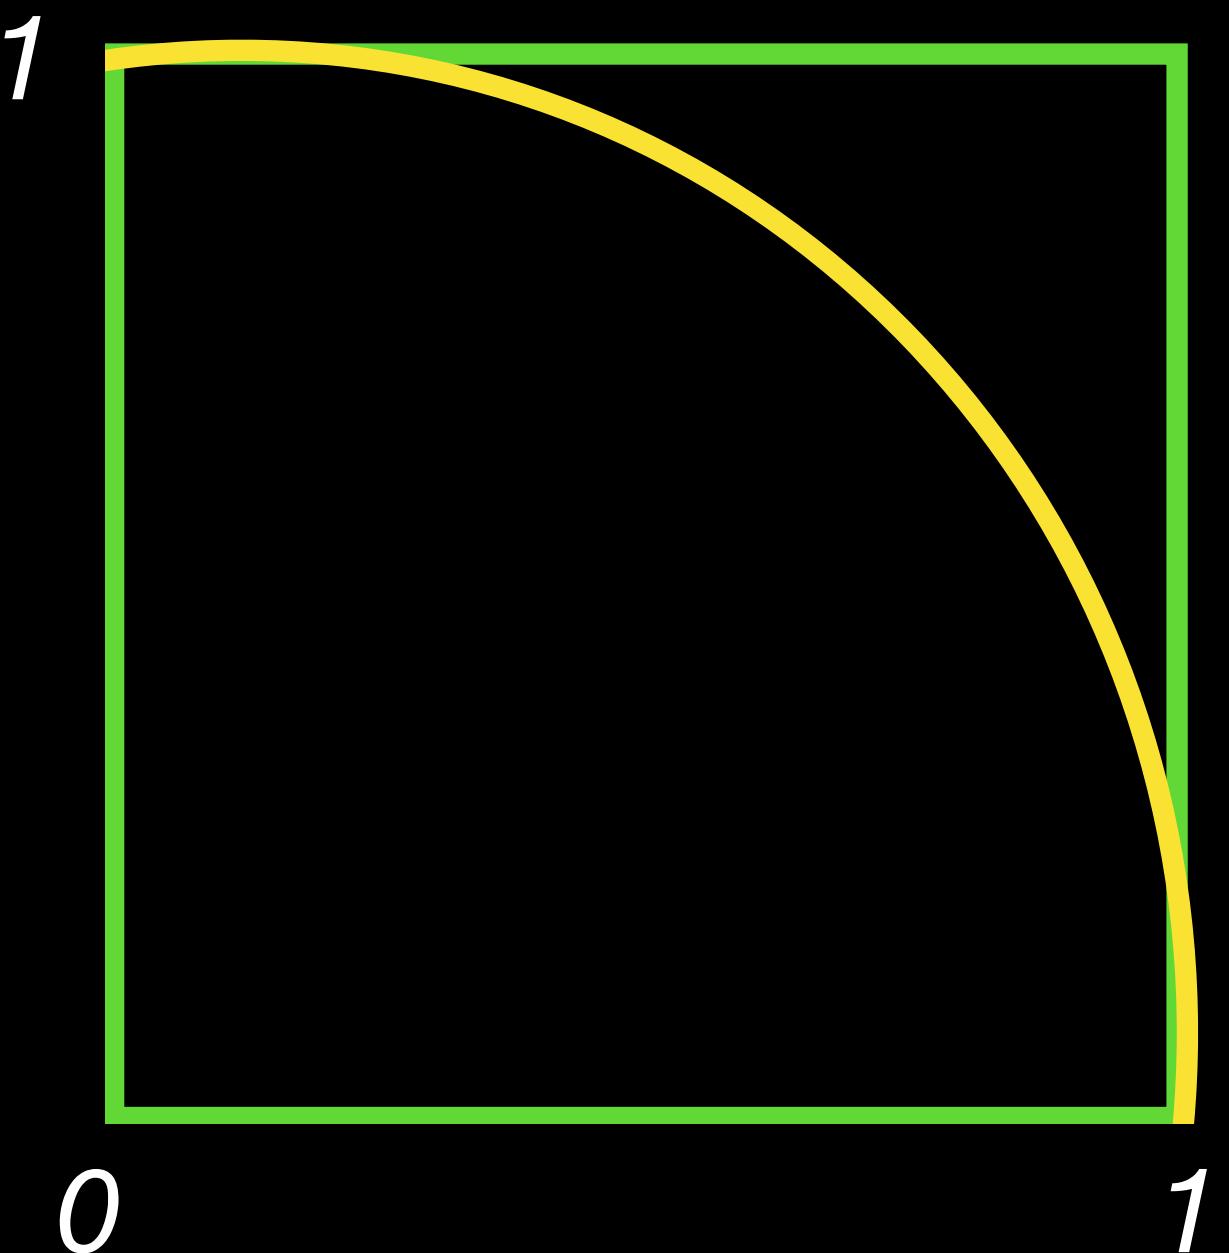

- Write a program that prints one random number between 0 and 1

```
import math  
import random  
print(random.random())
```

Pi Dartboard 2

- **Challenge:** Modify your program
 - Store the random number in a variable x
 - Store a second random number in a variable y
 - Print x and y

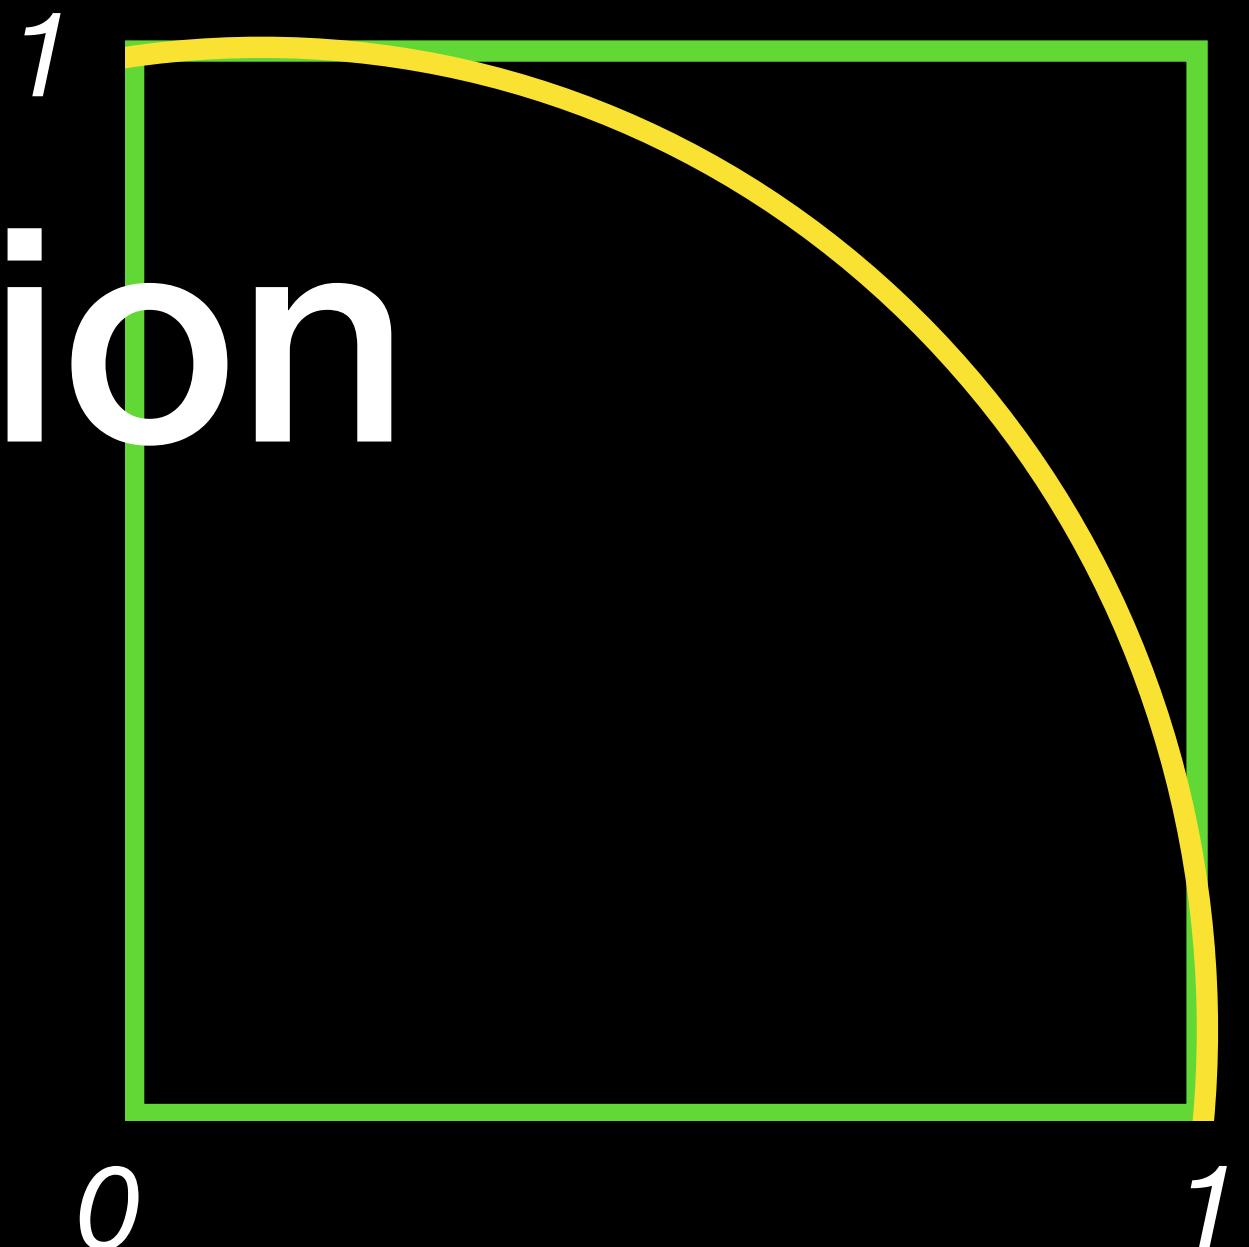

```
import math  
import random  
print(random.random())
```

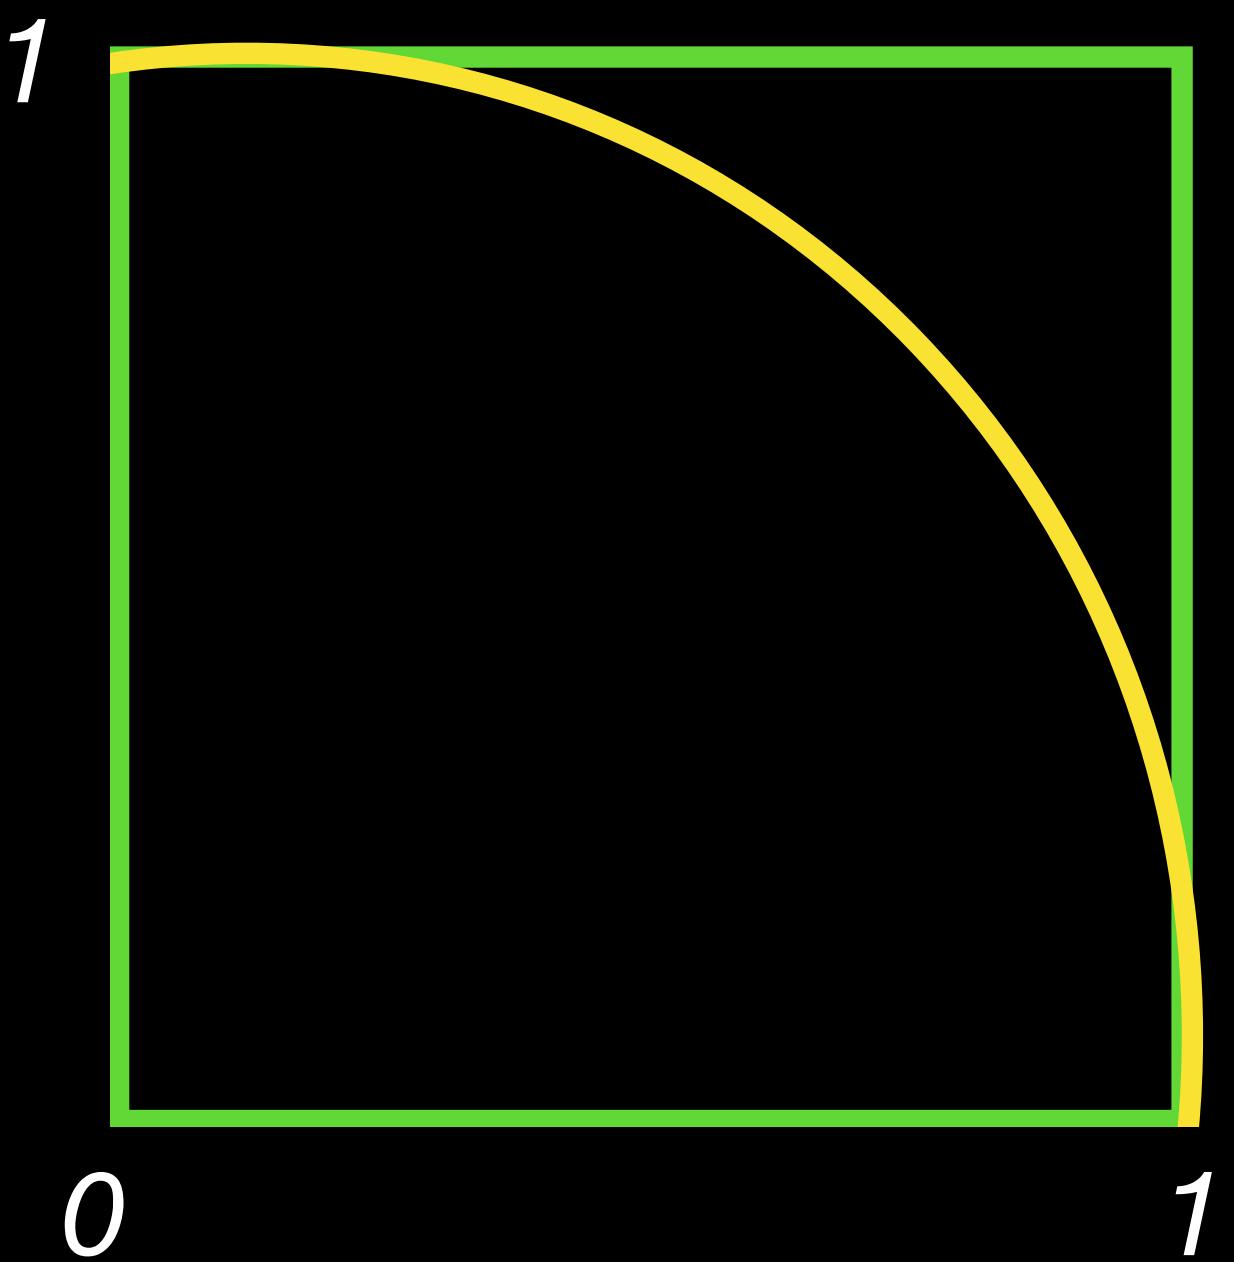

Pi Dartboard 2 Solution

- **Challenge:** Modify your program
 - Store the random number in a variable x
 - Store a second random number in a variable y
 - Print x and y

```
import math  
import random  
  
x = random.random()  
y = random.random()  
  
print(x)  
print(y)
```

Pi Dartboard 3

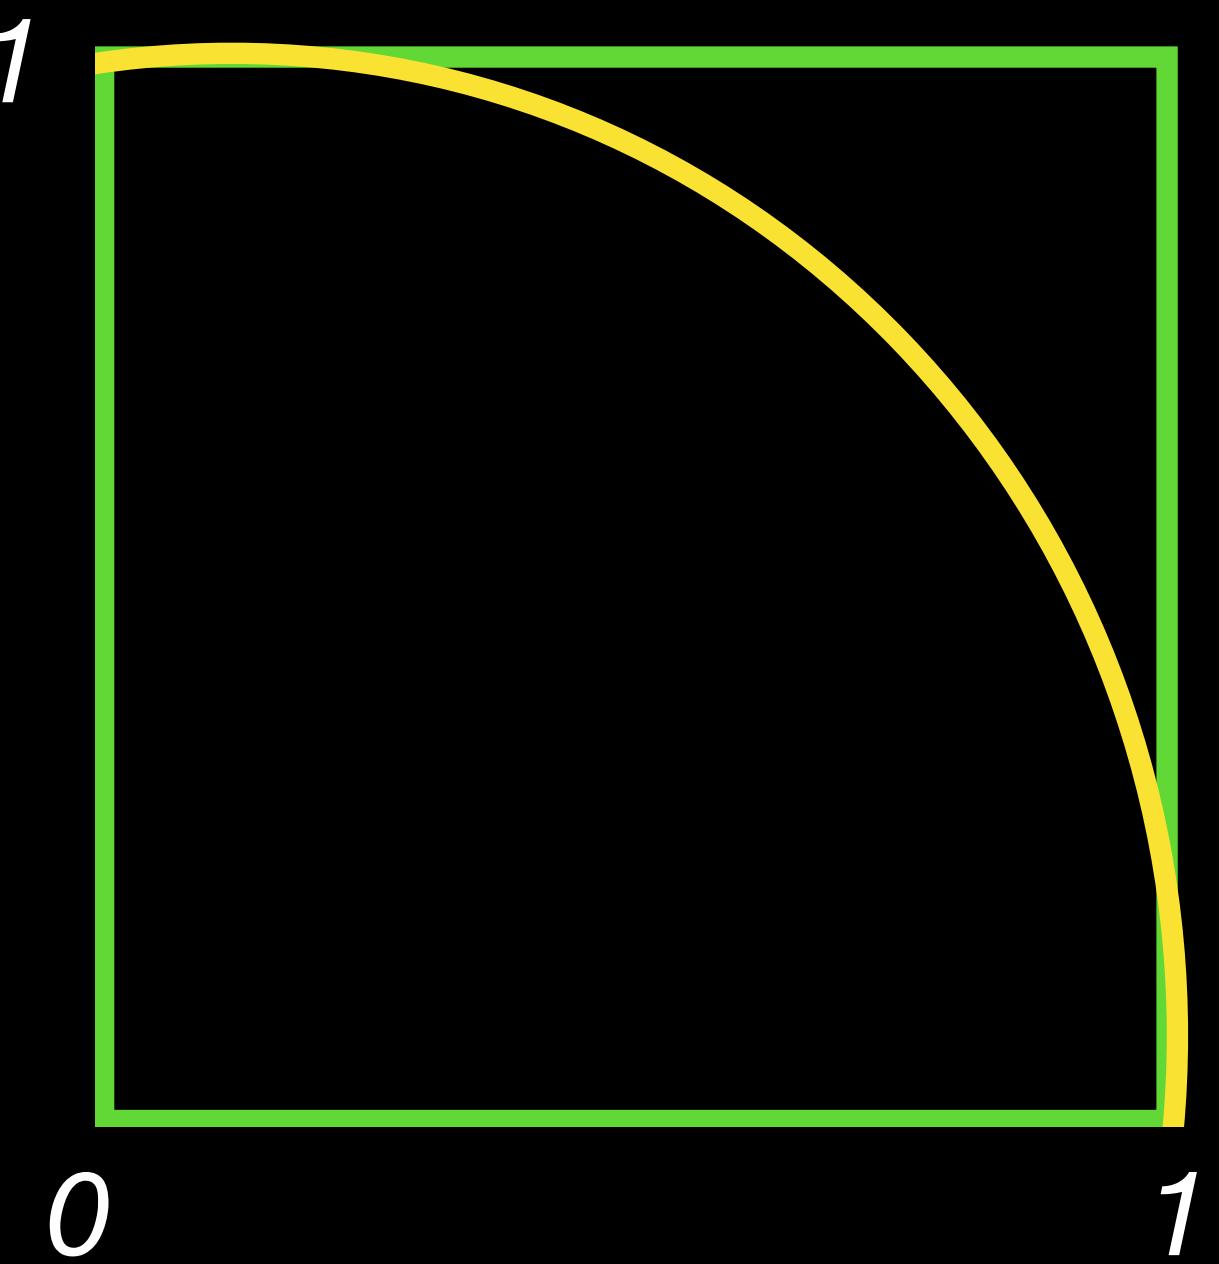

- **Challenge:** Modify your program
 - Print $x^2 + y^2$ instead of just x and y

```
import math  
import random  
  
x = random.random()  
y = random.random()  
  
print(x)  
print(y)
```

Pi Dartboard 3

- **Challenge:** Modify your program
 - Compute $x^2 + y^2$ and store it in a variable rSquared
 - Print rSquared instead of just x and y

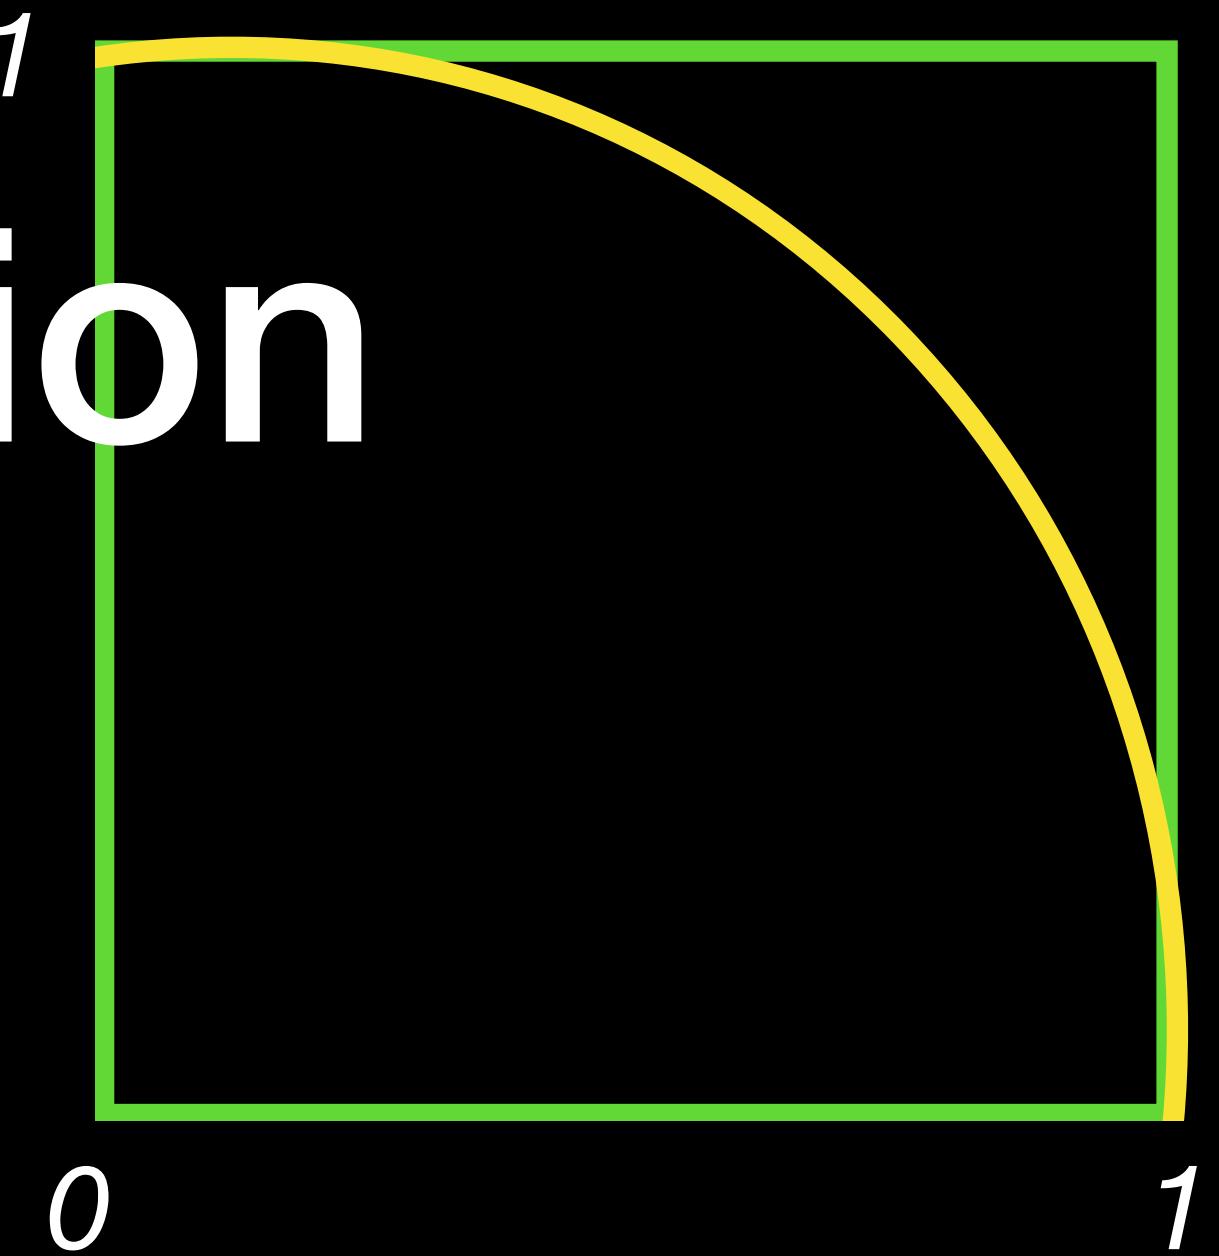

```
import math  
import random  
  
x = random.random()  
y = random.random()  
  
print(x)  
print(y)
```

Pi Dartboard 3 Solution

- **Challenge:** Modify your program
 - Compute $x^2 + y^2$ and store it in a variable rSquared
 - Print rSquared instead of just x and y

```
import math  
import random  
  
x = random.random()  
y = random.random()  
rSquared = x**2 + y**2  
print(rSquared)
```

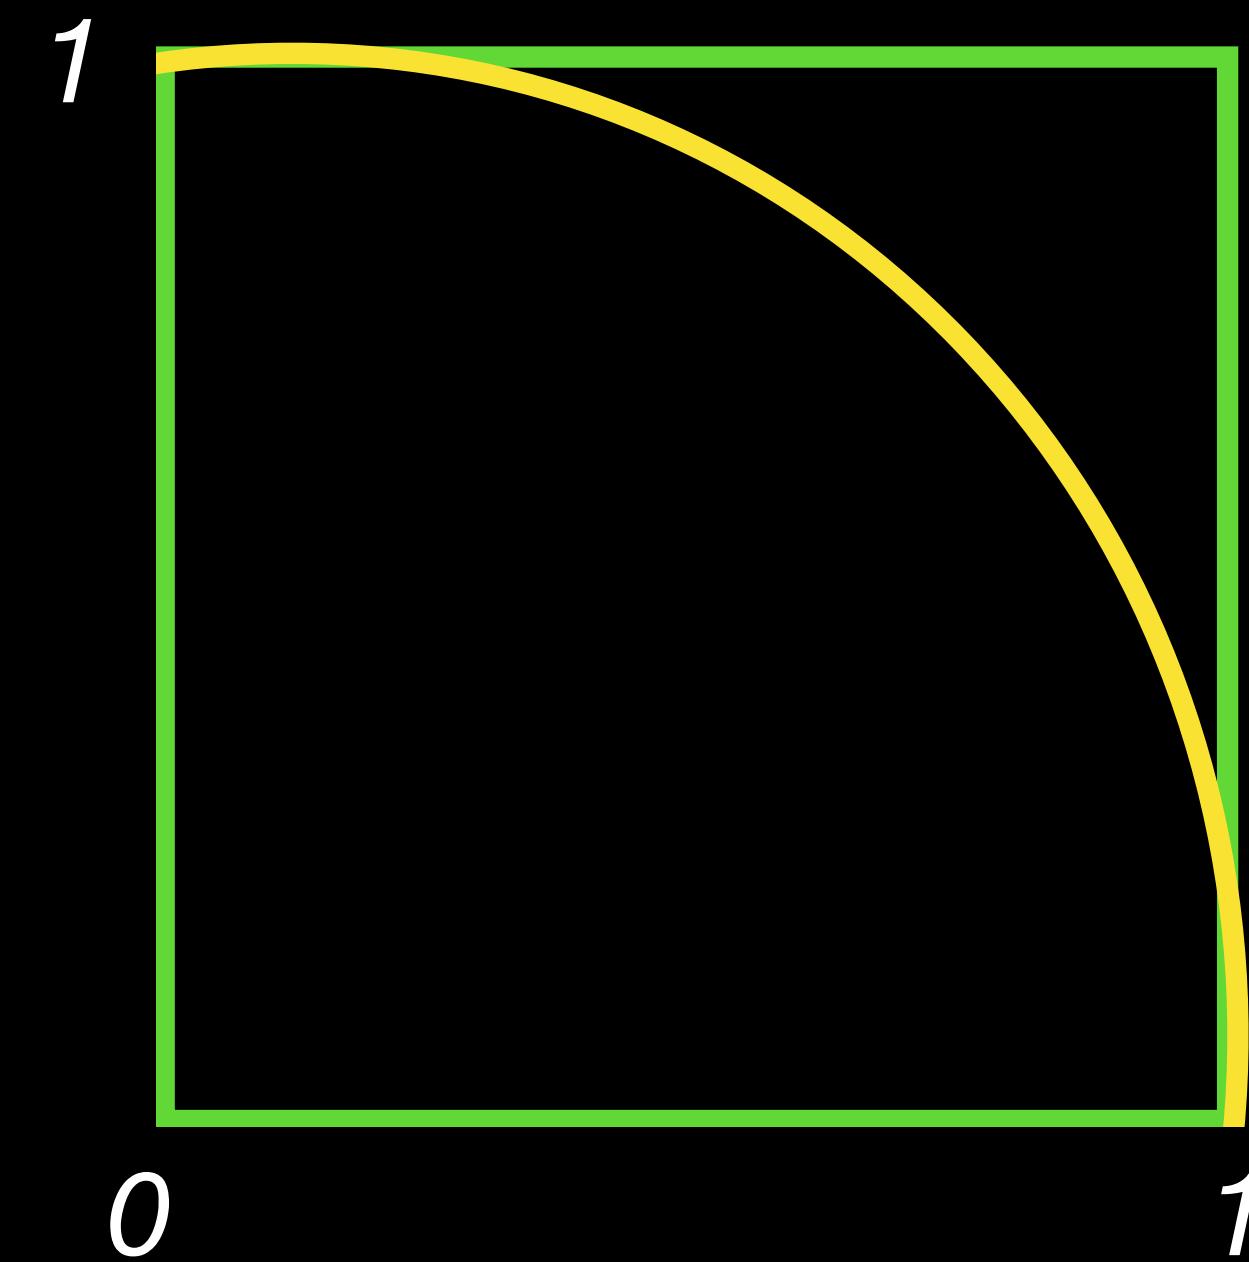

Clicker question #2.5

- Which could be a number the program prints?

```
import math  
import random  
  
x = random.random()  
y = random.random()  
  
rSquared = x**2 + y**2  
print(rSquared)
```

- | | |
|---|-------|
| A | -1.51 |
| B | 2.43 |
| C | -0.32 |
| D | 1.01 |

Clicker question #2.5

- If the dart is inside the **circle**, which could be the number printed by the program?

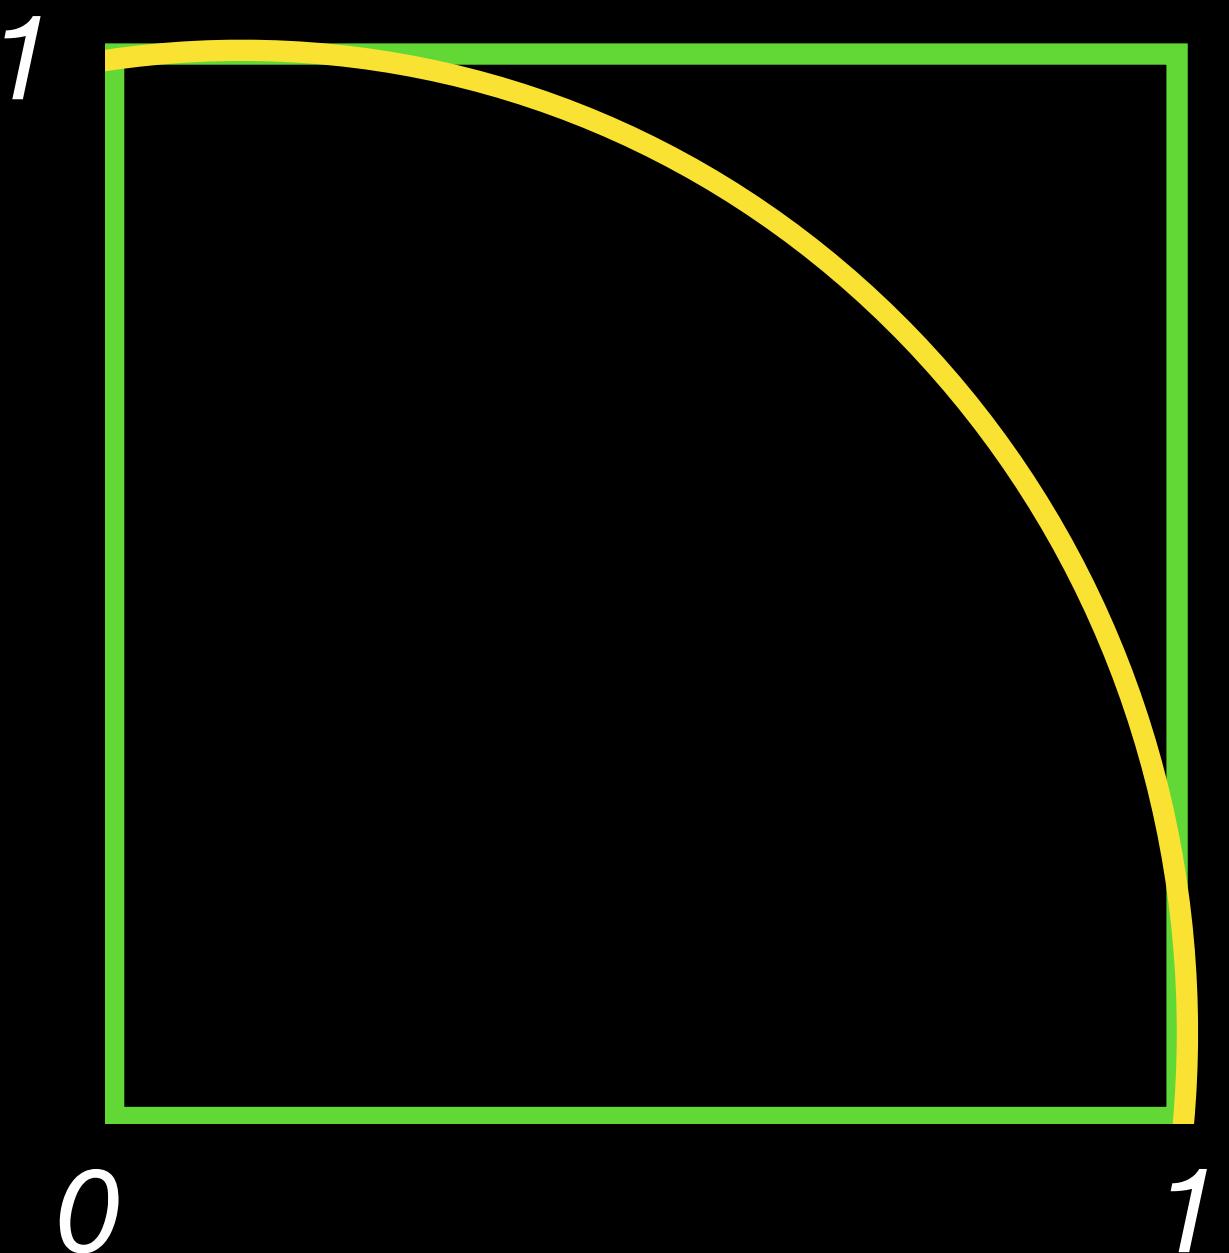

```
import math  
import random  
  
x = random.random()  
y = random.random()  
rSquared = x**2 + y**2  
print(rSquared)
```

Pi Dartboard 4

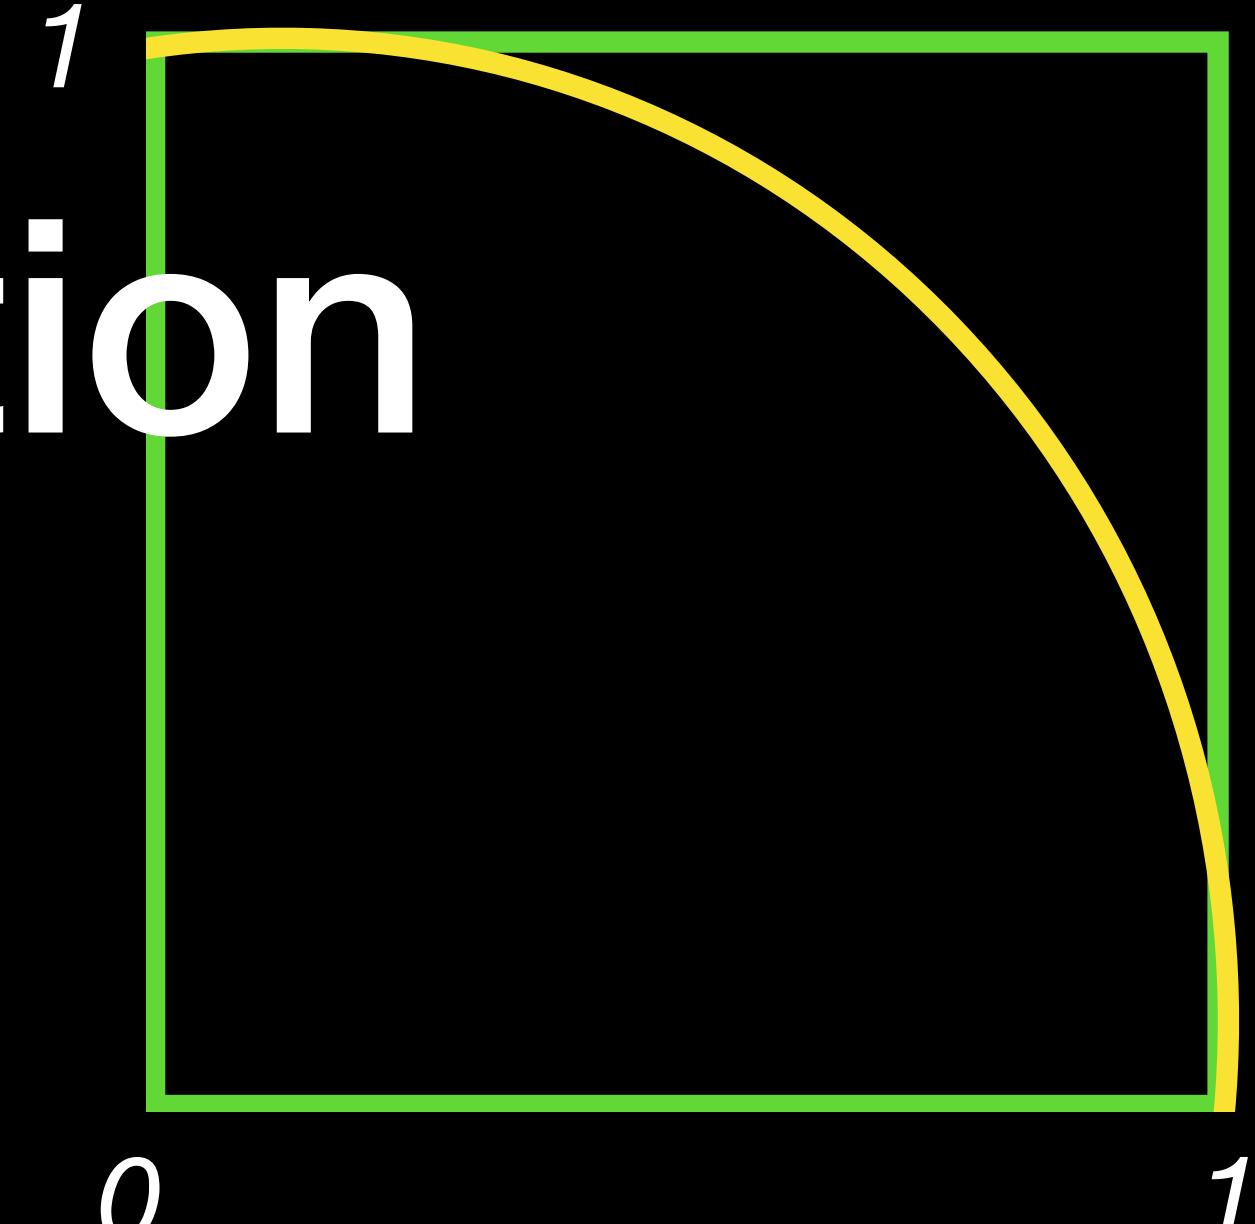

- **Challenge:** Modify your program
 - Just below import random, make a new variable called “hits”, set to 0
 - If rSquared < 1, add 1 to hits
 - Print hits instead of rSquared

```
import math  
import random  
  
x = random.random()  
y = random.random()  
rSquared = x**2 + y**2  
print(rSquared)
```

Pi Dartboard 4 Solution

- **Challenge:** Modify your program
 - Just below import random, make a new variable called “hits”, set to 0
 - If rSquared < 1, add 1 to hits
 - Print hits instead of rSquared

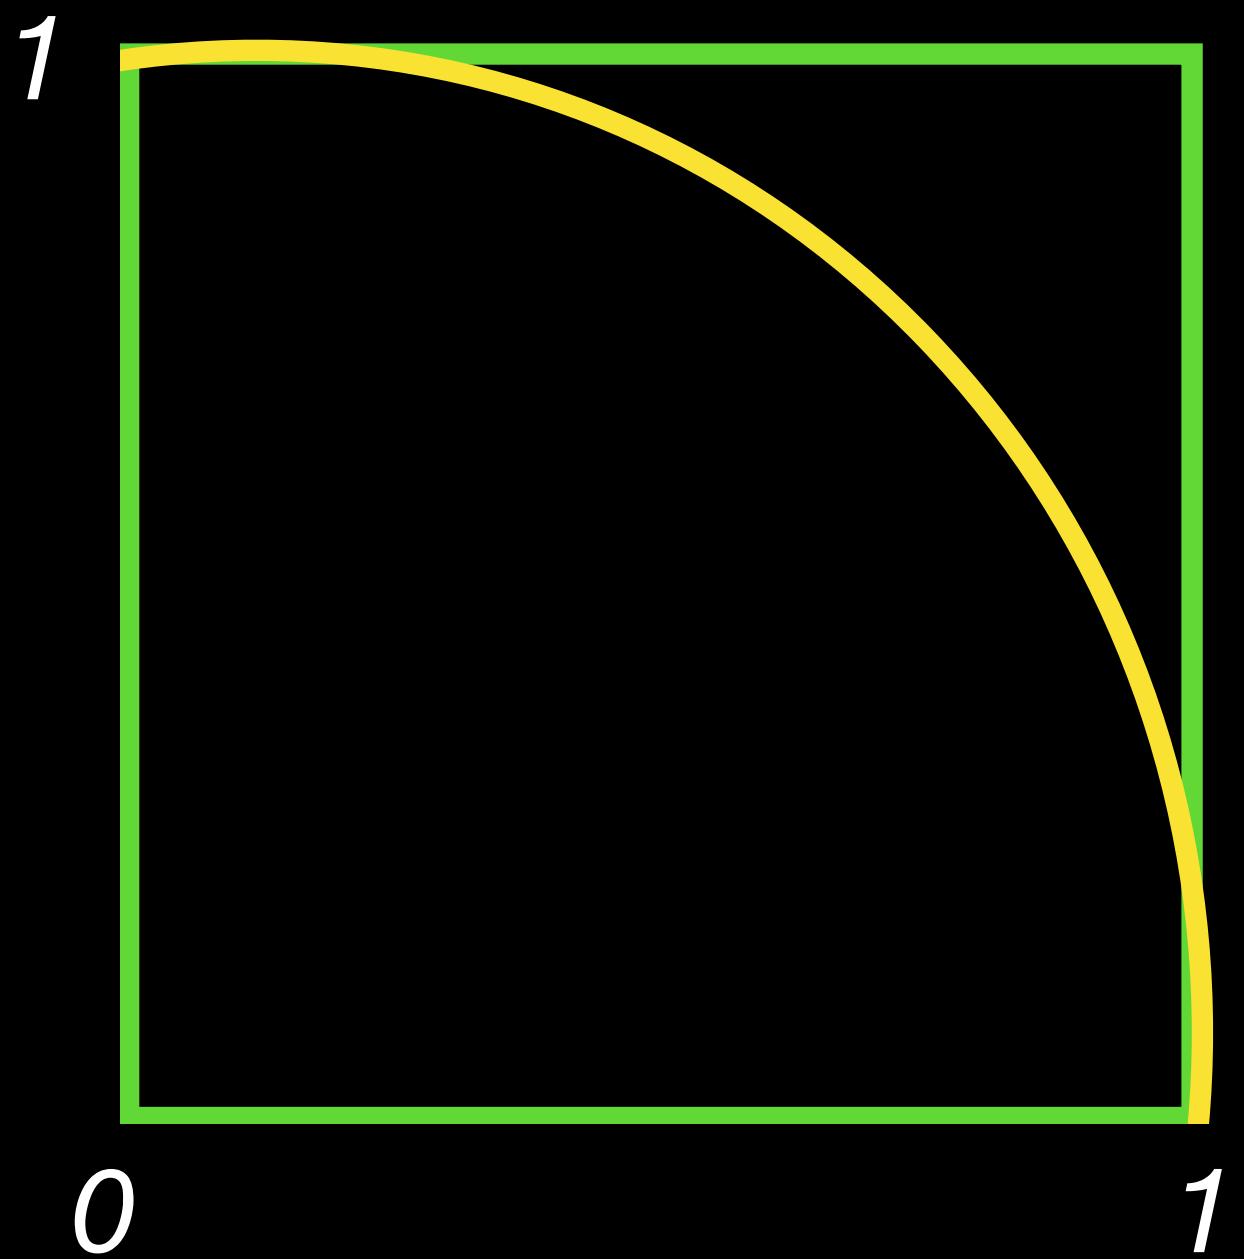

```
import math 0
import random
hits = 0
x = random.random()
y = random.random()
rSquared = x**2 + y**2
if rSquared < 1:
    hits = hits + 1
print(hits)
```

Pi Dartboard 5

- **Challenge:** Modify your program
 - Add a new variable, just below hits, called throws. Set it equal to 10.
 - Put the code that throws the dart and sees if it hit inside a while loop, so that you throw 10 darts instead of 1 dart
 - Don't forget to increment your while loop counter variable (i or j or whatever)

```
import math
import random
hits = 0
x = random.random()
y = random.random()
rSquared = x**2 + y**2
if rSquared < 1:
    hits = hits + 1
print(hits)
```

Pi Dartboard 5 Solution

- **Challenge:** Modify your program
- Add a new variable, just below hits, called throws. Set it equal to 10.
- Put the code that throws the dart and sees if it hit inside a while loop, so that you throw 10 darts instead of 1 dart

```
import math
import random

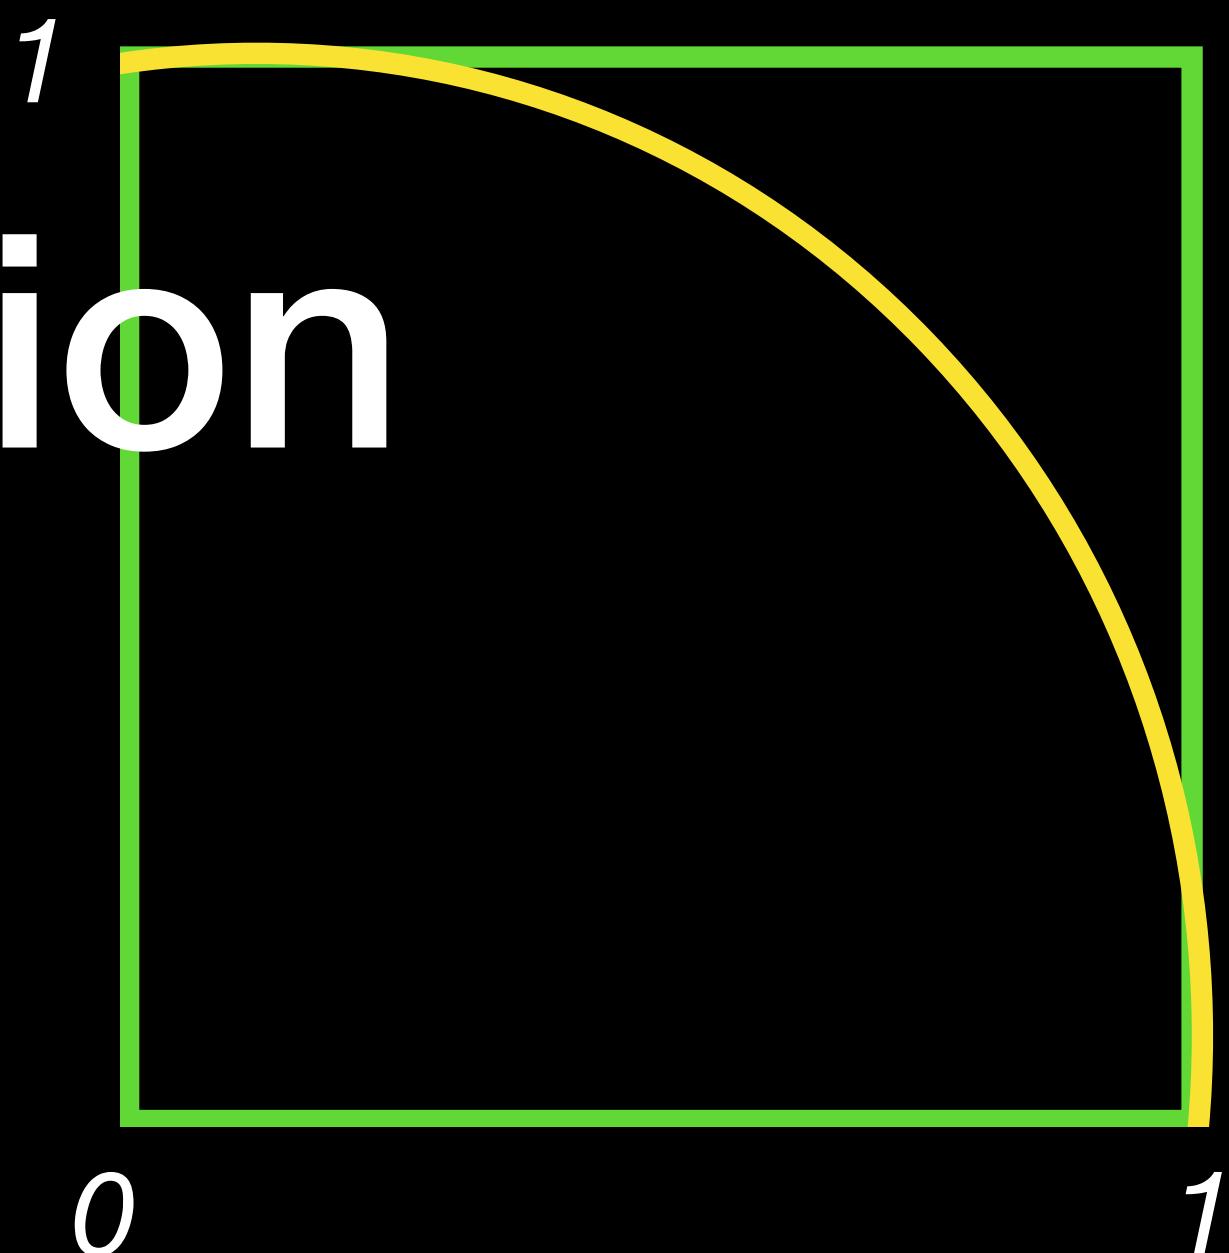

hits = 0
throws = 10

i = 0
while i < throws:
    x = random.random()
    y = random.random()

    rSquared = x**2 + y**2

    if rSquared < 1:
        hits = hits + 1
    i = i + 1

print(hits)
```

A silly way to compute π

- Throw darts in square
 - $(\text{circle area}) \div (\text{square area}) \approx \text{hits} \div \text{throws} = \pi/4$
 - So $\pi \approx 4 * (\text{hits} \div \text{throws})$

Courtesy wikipedia

Pi Dartboard 6

- Finish the dartboard
- Compute pi as $4.0 * \text{float(hits)} / \text{float(throws)}$
- Print your pi estimate

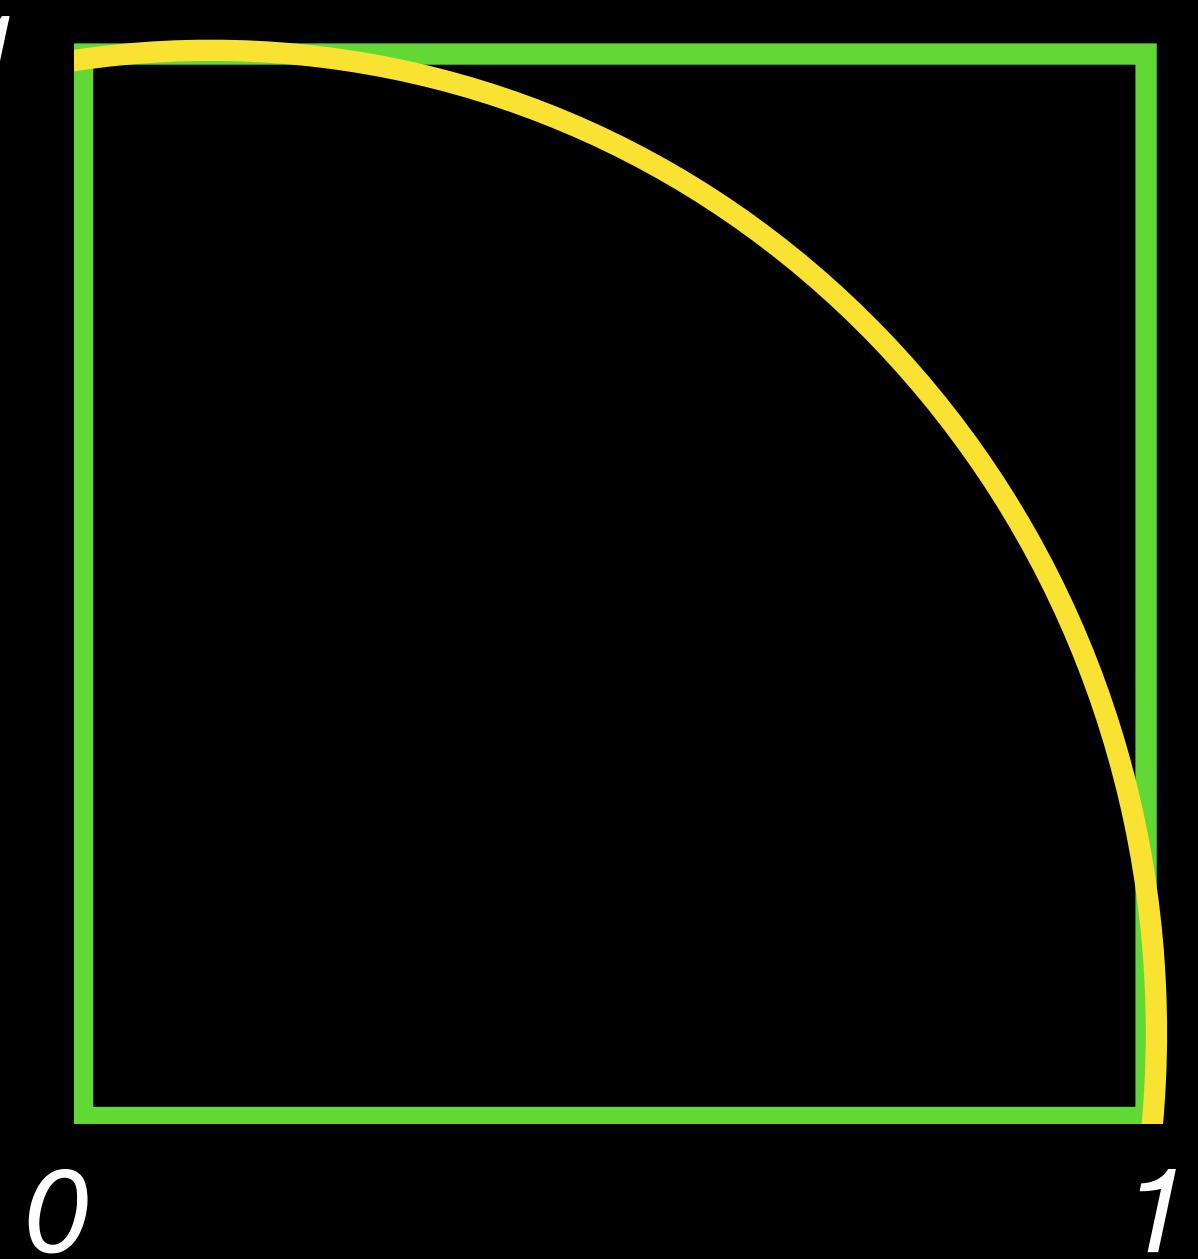

```
import math
import random

hits = 0
throws = 10

i = 0
while i < throws:
    x = random.random()
    y = random.random()

    rSquared = x**2 + y**2
    if rSquared < 1:
        hits = hits + 1
    i = i + 1

print(hits)
```

Pi Dartboard 6 Solution

- Finish the dartboard
- Compute pi as $4.0 * \text{float(hits)} / \text{float(throws)}$
- Print your pi estimate

```
import math
import random

hits = 0
throws = 10

i = 0
while i < throws:
    x = random.random()
    y = random.random()

    rSquared = x**2 + y**2

    if rSquared < 1:
        hits = hits + 1
        i = i + 1

pi = 4.0 * float(hits) / float(throws)
print(pi)
```

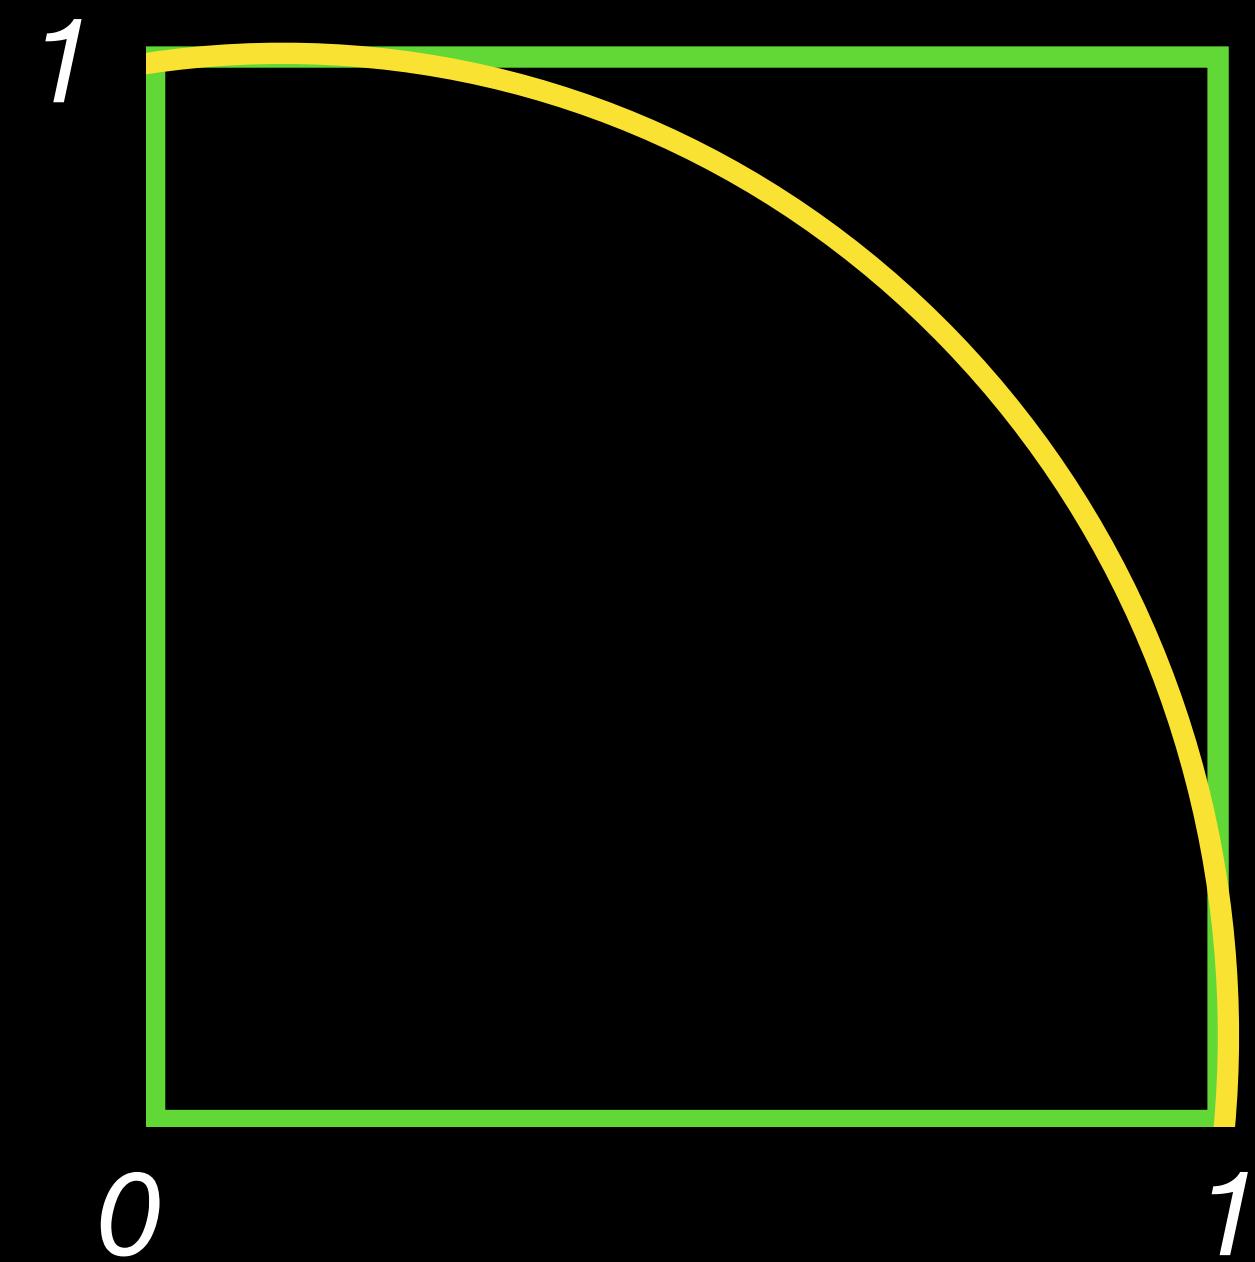

Pi Dartboard 7

- See what happens as you make throws 10^{**n} , $n=1,2,3,4,5,6,7$

- For $n=7$, how does speed compare if you do

```
rSquared = x*x +  
y*y
```

```
import math  
import random  
  
hits = 0  
throws = 10  
  
i = 0  
while i < throws:  
    x = random.random()  
    y = random.random()  
  
    rSquared = x*x + y*y  
    if rSquared < 1:  
        hits = hits + 1  
    i = i + 1  
  
pi = 4.0 * float(hits) / float(throws)  
print(pi)
```

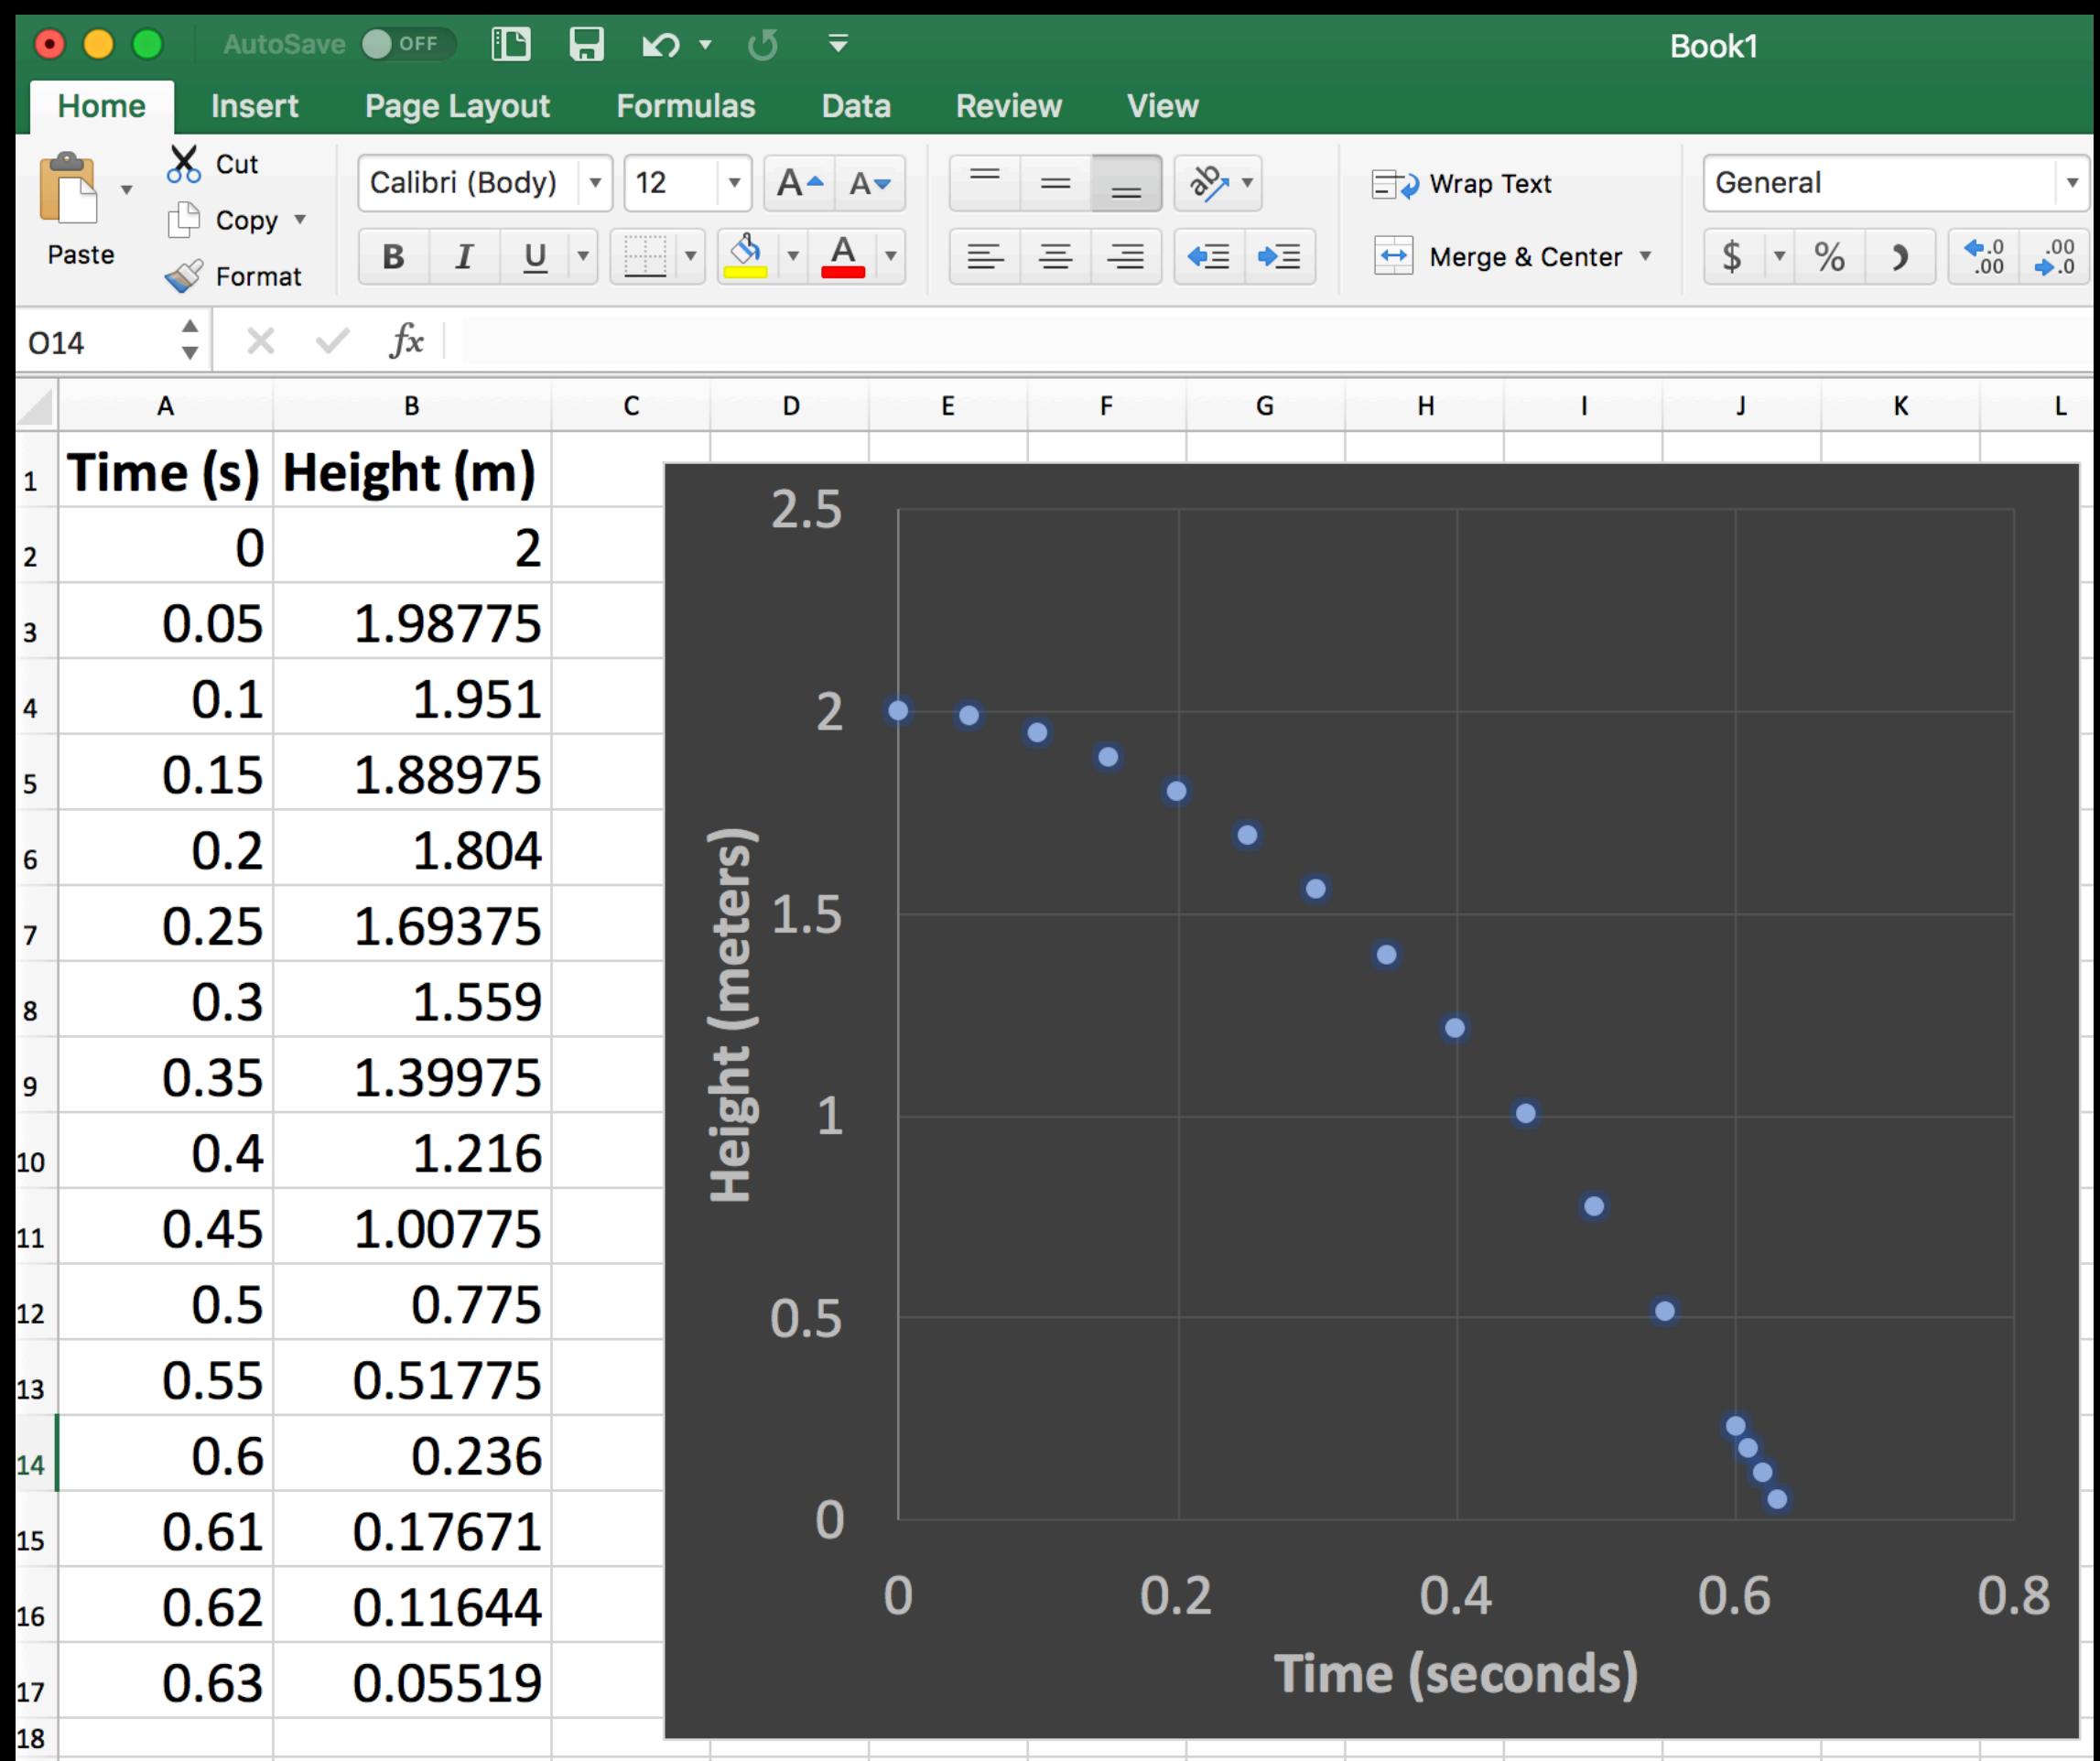

Plotting your results

- Scatter plots
- Lists and numpy arrays
- Pyplot plotting

Scatter plots

- Data: result or output given some input
 - Example: dropped marker height vs. time
 - Tools to make scatter plots
 - Excel
 - Python
 - Lists of numbers
 - Computations on lists of numbers: numpy arrays
 - pyplot: makes scatter plots

Lists

- **Values** - ordered sets of objects, all the same type (like floats or ints)

```
x = [-2.0, -1.0, 0.0, 1.0, 2.0]
y = ["Hello", "world"]
z = [1, 4, 9, 16]
```

- **Operators** -
[], .append()

```
z.append(25) == [1, 4, 9, 16, 25]
```

- **Easily add on elements in loops** with .append()

```
x[0] == -2.0
x[1] == -1.0
x[4] == 2.0
y[0] == "Hello"
y[-1] == "world"
z[-1] == 16
z[0] == 1
```

Loop over lists

```
for i in [0,1,2,3]:  
    print(i*i)
```

0
1
4
9

```
import numpy as np  
print(np.arange(1,5,1))  
[1,2,3,4]
```

```
import numpy as np  
myCountArray = np.arange(1,5)  
myList = []  
for i in myCountArray:  
    myList.append(i*i)  
print(myCountArray)  
print(myList)
```

[1,2,3,4]
[1,4,9,16]

Clicker question #2.6

- What value does the program print?

```
x = [1.0, 4.0, 9.0]  
print(x[1])
```

- A 1.0
- B 4.0
- C 9.0
- D The entire list

Numpy arrays

- **Values** - ordered sets of objects, all the same type (like floats or ints)

- **Operators** - `[]`, `+`, `-`, `*`, `/`,
`np.sqrt()`, `np.sin()`, `np.cos()`,
...

- **Easily do math on whole lists at once** (like formulas in Excel)

```
x = np.array([-2.0, -1.0, 0.0, 1.0, 2.0])
y = np.array(["Hello", "world"])
q = np.array([1, 2, 3, 4])
r = q * 2
s = q + r
z = q * q
```

```
r == np.array([2, 4, 6, 8])
s == np.array([3, 6, 9, 12])
z == np.array([1, 4, 9, 16])
```

```
x[0] == -2.0
x[1] == -1.0
x[4] == 2.0
y[0] == "Hello"
y[-1] == "world"
z[-1] == 16
z[0] == 1
```

Making sample data

- Annoying to type [1,2,3,4,...] all the time
- Instead: np.arange(start, stop, step)
- What do all these numbers mean??
- Make a plot to visualize them

Try in cocalc!

```
import numpy as np
x = np.arange(-4.0, 4.0, 0.01)
y = np.sin(x)**3
print(x)
print(y)
```

```

```

Plotting sample data

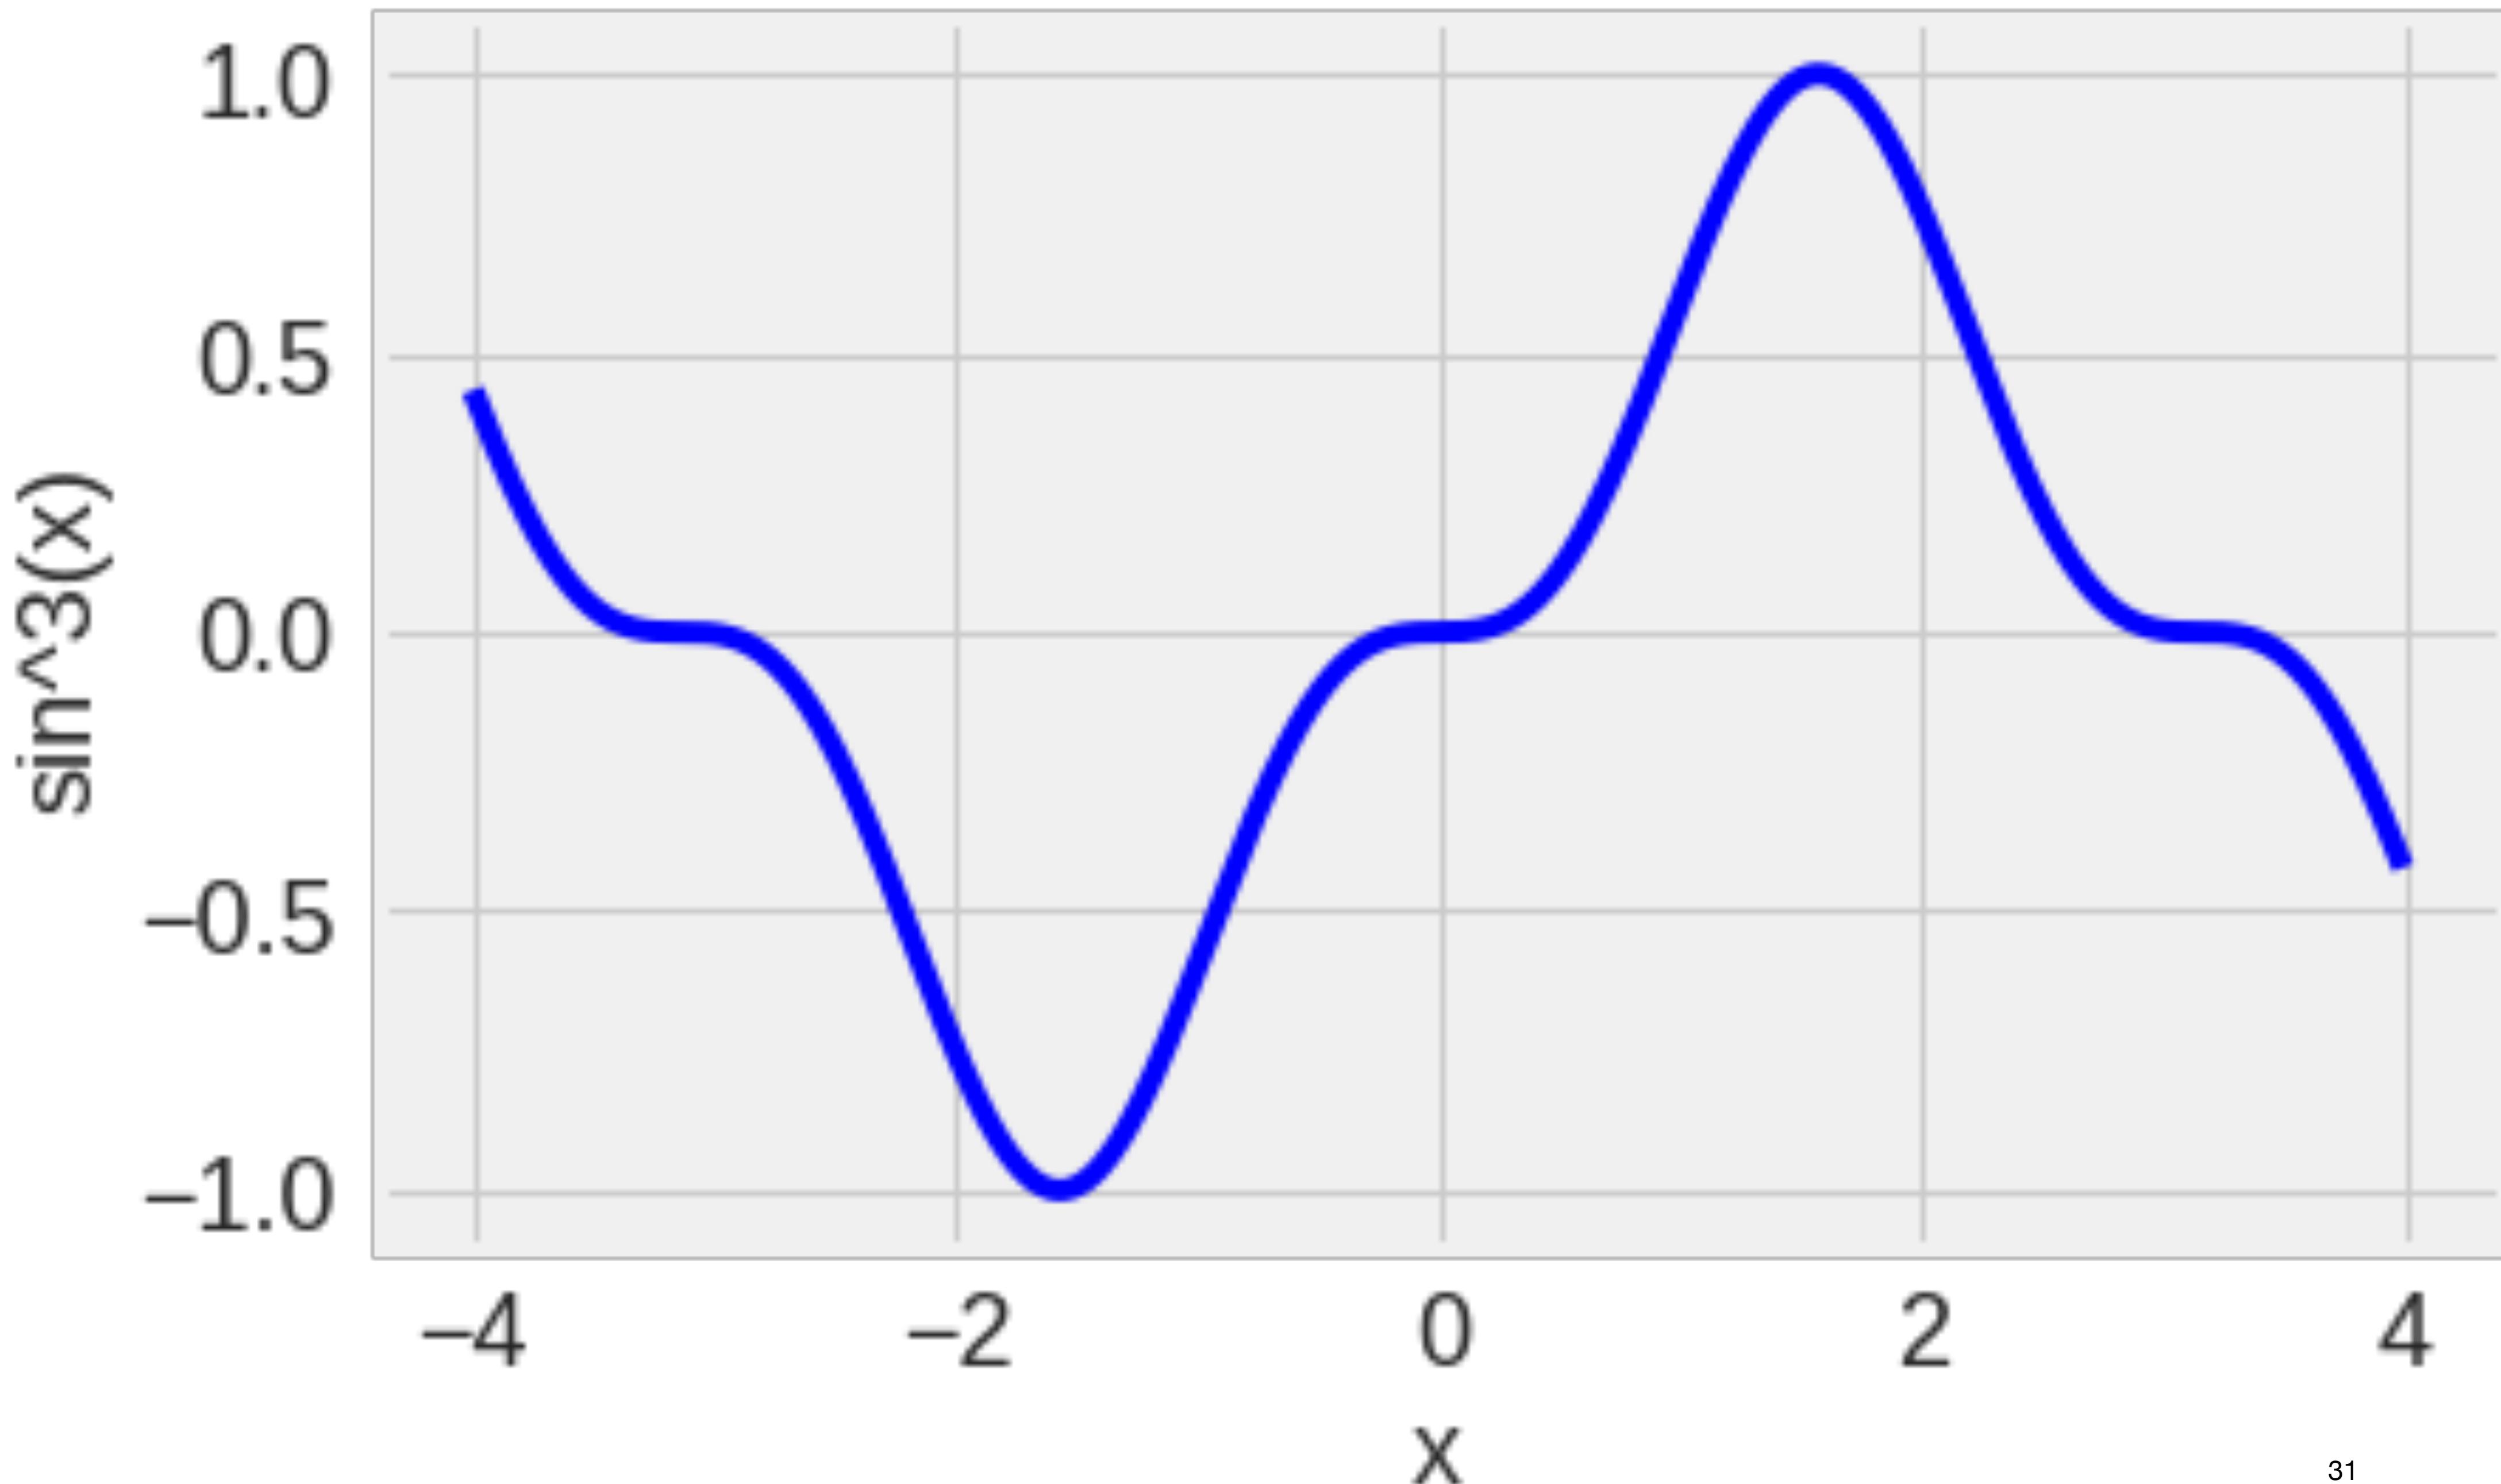

Try in cocalc!

```
import numpy as np
import matplotlib
from matplotlib import pyplot as plt
matplotlib.rc('axes', labelsize=18)
matplotlib.rc('xtick', labelsize = 18)
matplotlib.rc('ytick', labelsize = 18)
```

- Make plots with pyplot

```
x = np.arange(-4.0, 4.0, 0.01)
y = np.sin(x)**3
```

```
plt.clf() #clear figure
plt.plot(x,y, color='b')
plt.xlabel('x')
plt.ylabel('sin^3(x)')
plt.show()
```

Functions

Try in cocalc!

```
def square(x):  
    return x*x
```

```
square(4)  
16
```

- Input(s) ("arguments")
- Returns output
- Functions can call other functions

Plotting π 1

- Activity: edit your code
 - Make everything but the last two lines inside a function that takes one input, n
 - Instead of setting throws = 10, set throws=n
 - Return the pi estimate

```
import math
import random

hits = 0
throws = 10

i = 0
while i < throws:
    x = random.random()
    y = random.random()

    rSquared = x*x + y*y

    if rSquared < 1:
        hits = hits + 1
    i = i + 1

pi = 4.0 * float(hits) / float(throws)
print(pi)
```

Solution 1

- Activity: edit your code
- Make everything but the last two lines inside a function that takes one input, n
- Instead of setting throws = 10, set throws=n
- Return the pi estimate

```
import math
import random

def estimatePi(throws):
    hits = 0
    i = 0
    while i < throws:
        x = random.random()
        y = random.random()

        rSquared = x*x + y*y
        if rSquared < 1:
            hits = hits + 1
        i = i + 1

    pi = 4.0 * float(hits) / float(throws)
    return pi

print(estimatePi(1e4))
```

Plotting π^2

```
import math  
import random  
  
def estimatePi(throws):  
    # (same definition of estimatePi function here)  
    return pi  
  
piEstimates = [estimatePi(x) for x in [10, 100, 1000, 10000]]  
print(piEstimates)
```

Plotting π^2

```
import math
import random

def estimatePi(throws):
    # (same definition of estimatePi function here)
    return pi

trials = [10**j for j in np.arange(0,6)]
piEstimates = [estimatePi(x) for x in trials]
print(trials, piEstimates)
```

Plotting π^2

```
import math
import random

def estimatePi(throws):
    # (same definition of estimatePi function here)
    return pi

trials = [10**j for j in np.arange(0,6)]
piEstimates = [estimatePi(x) for x in trials]
print(trials, piEstimates)

plt.clf()
plt.plot(x,y)
plt.xlabel("x")
plt.ylabel("y")
plt.show()
```

Plotting π^2

```
import math  
import random  
  
def estimatePi(throws):  
    # (same definition of estimatePi function here)  
    return pi  
  
trials = [10**j for j in np.arange(0,6)]  
piEstimates = [estimatePi(x) for x in trials]  
print(trials, piEstimates)  
  
plt.clf()  
plt.plot(trials,piEstimates)  
plt.xlabel("Darts thrown")  
plt.ylabel("pi Estimate")  
plt.xscale('log')  
plt.show()
```

Plotting π^2

```
import math  
import random
```

```
def estimatePi(throws):  
    # (same definition of estimatePi function here)  
    return pi
```

```
trials = [10**j for j in np.arange(0,6)]  
piEstimates = [estimatePi(x) for x in trials]  
print(trials, piEstimates)
```

```
plt.clf()  
plt.plot(trials,np.abs(np.array(piEstimates)-np.pi))  
plt.xlabel("Darts thrown")  
plt.ylabel("pi Estimate")  
plt.xscale('log')  
plt.show()
```

Plotting π 2

```
import math  
import random
```

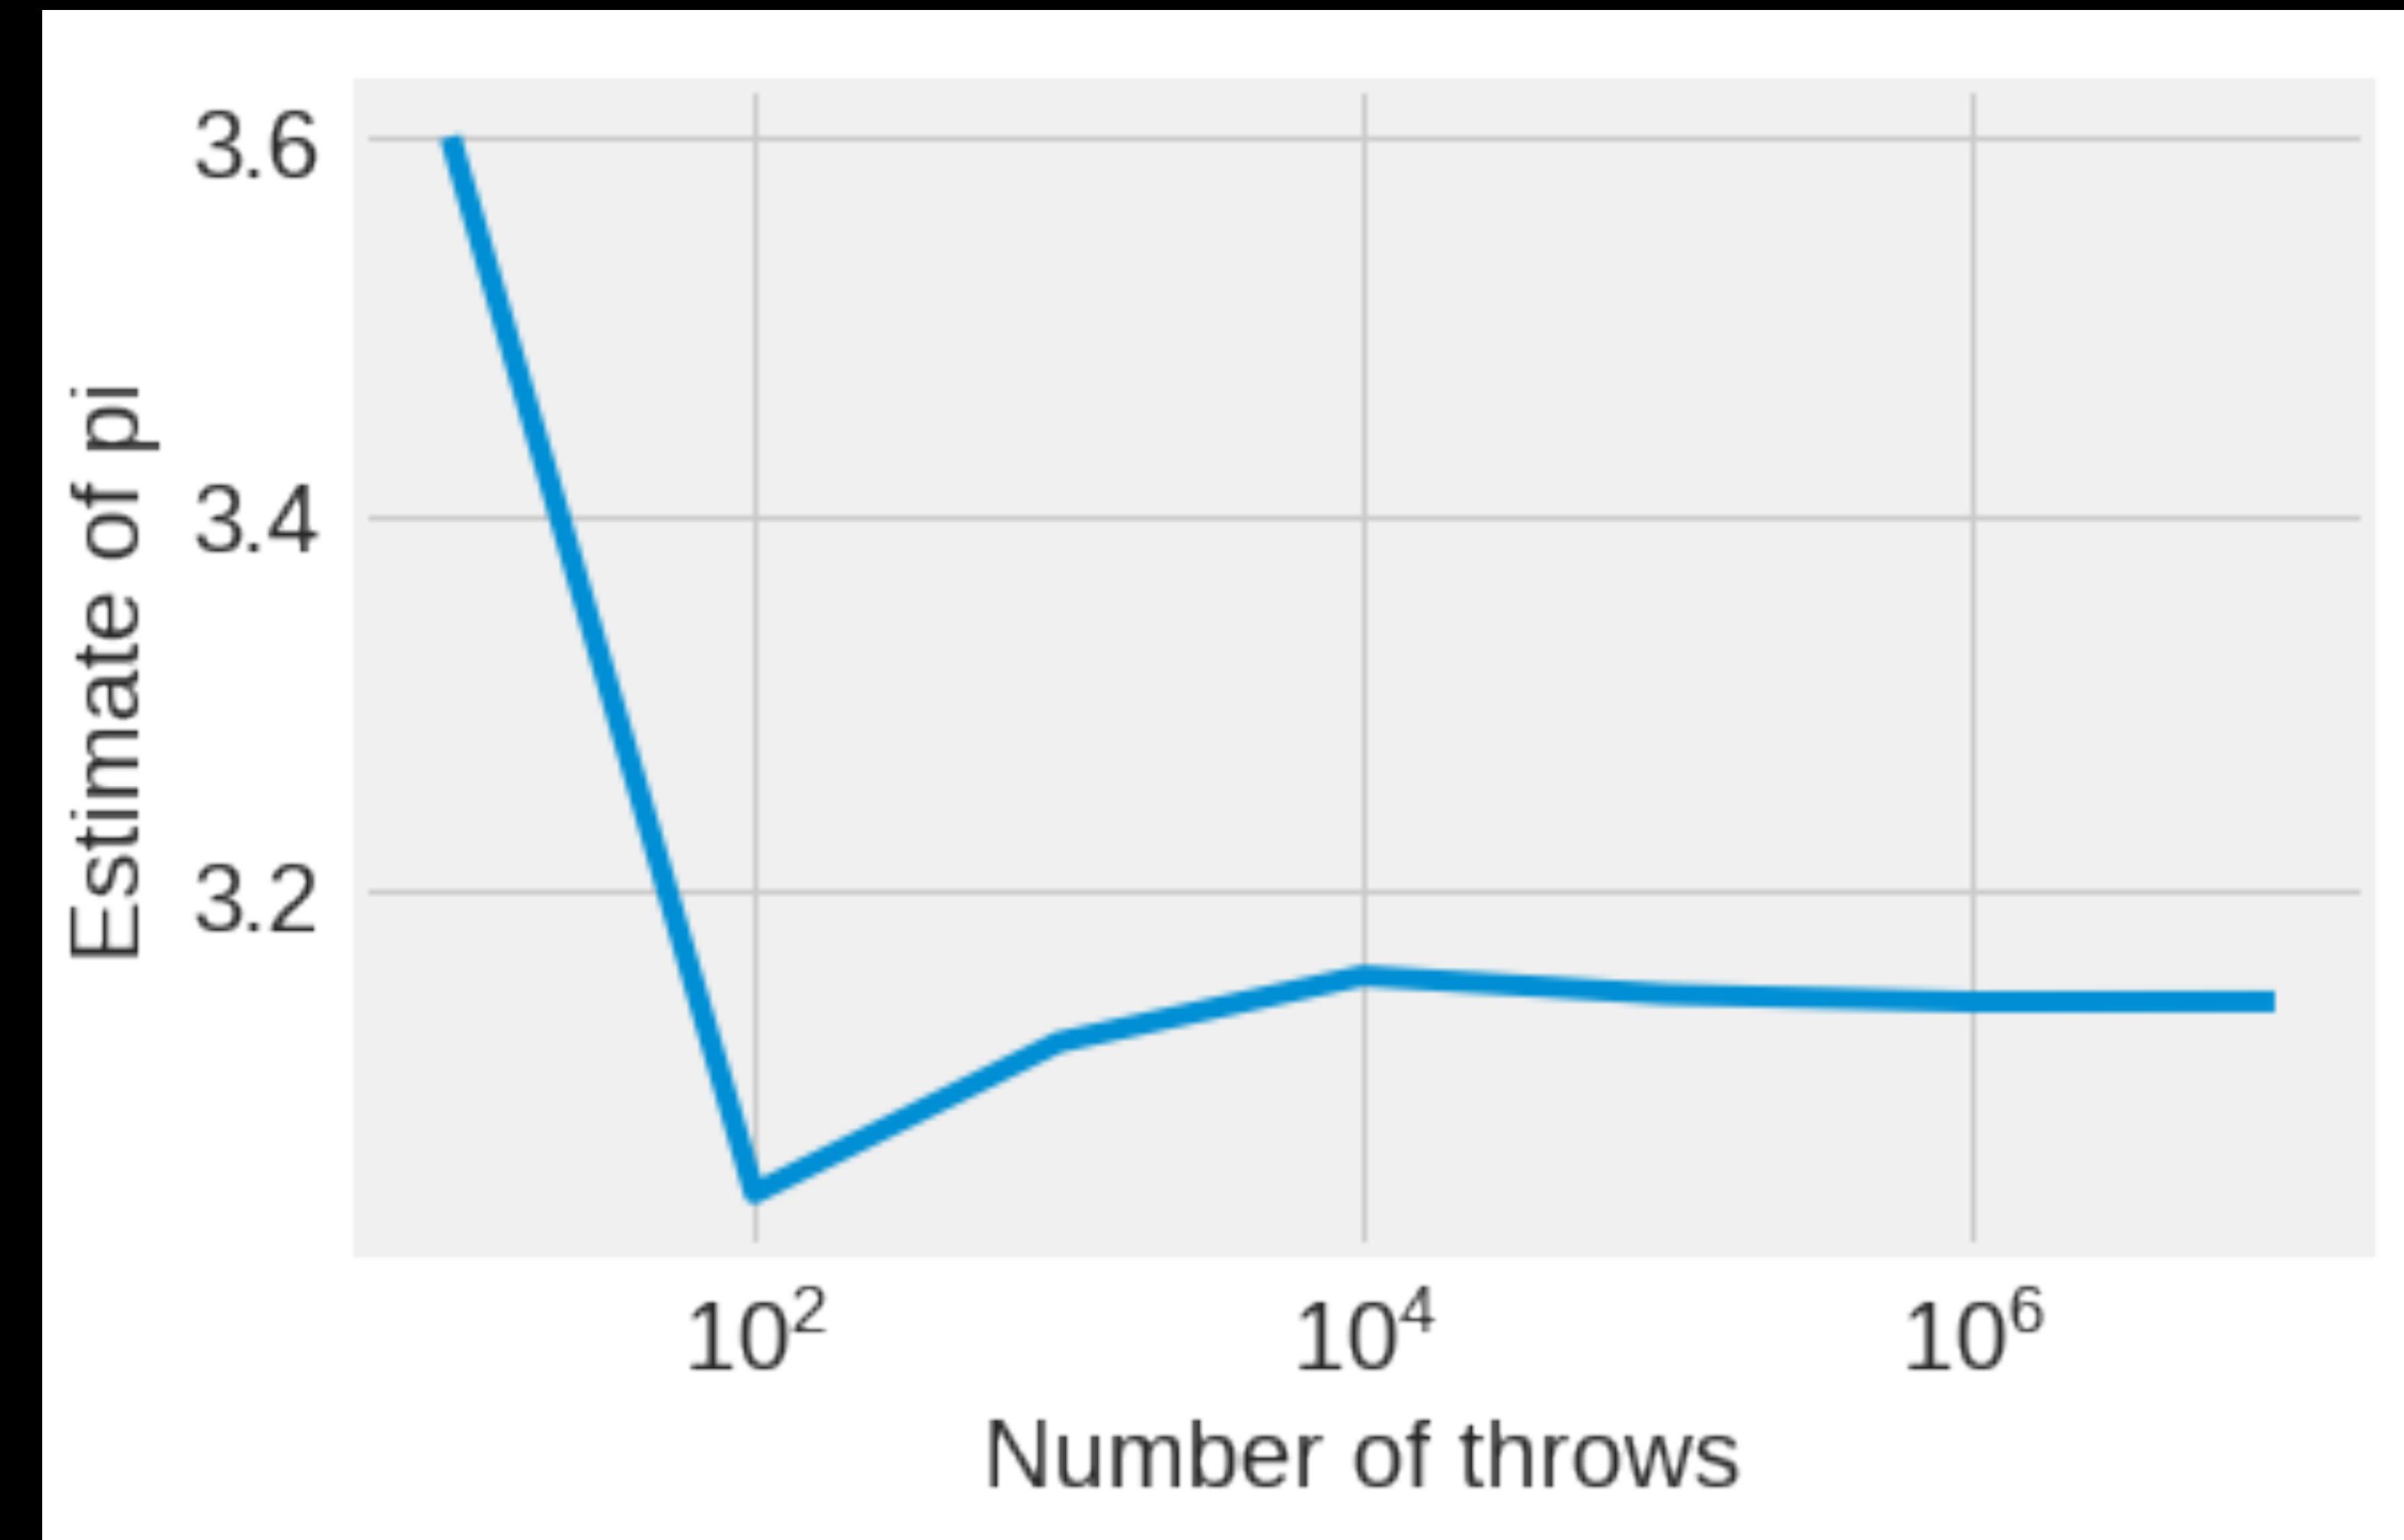

```
def estimatePi(throws):  
    # (same definition of estimatePi function here)  
    return pi
```

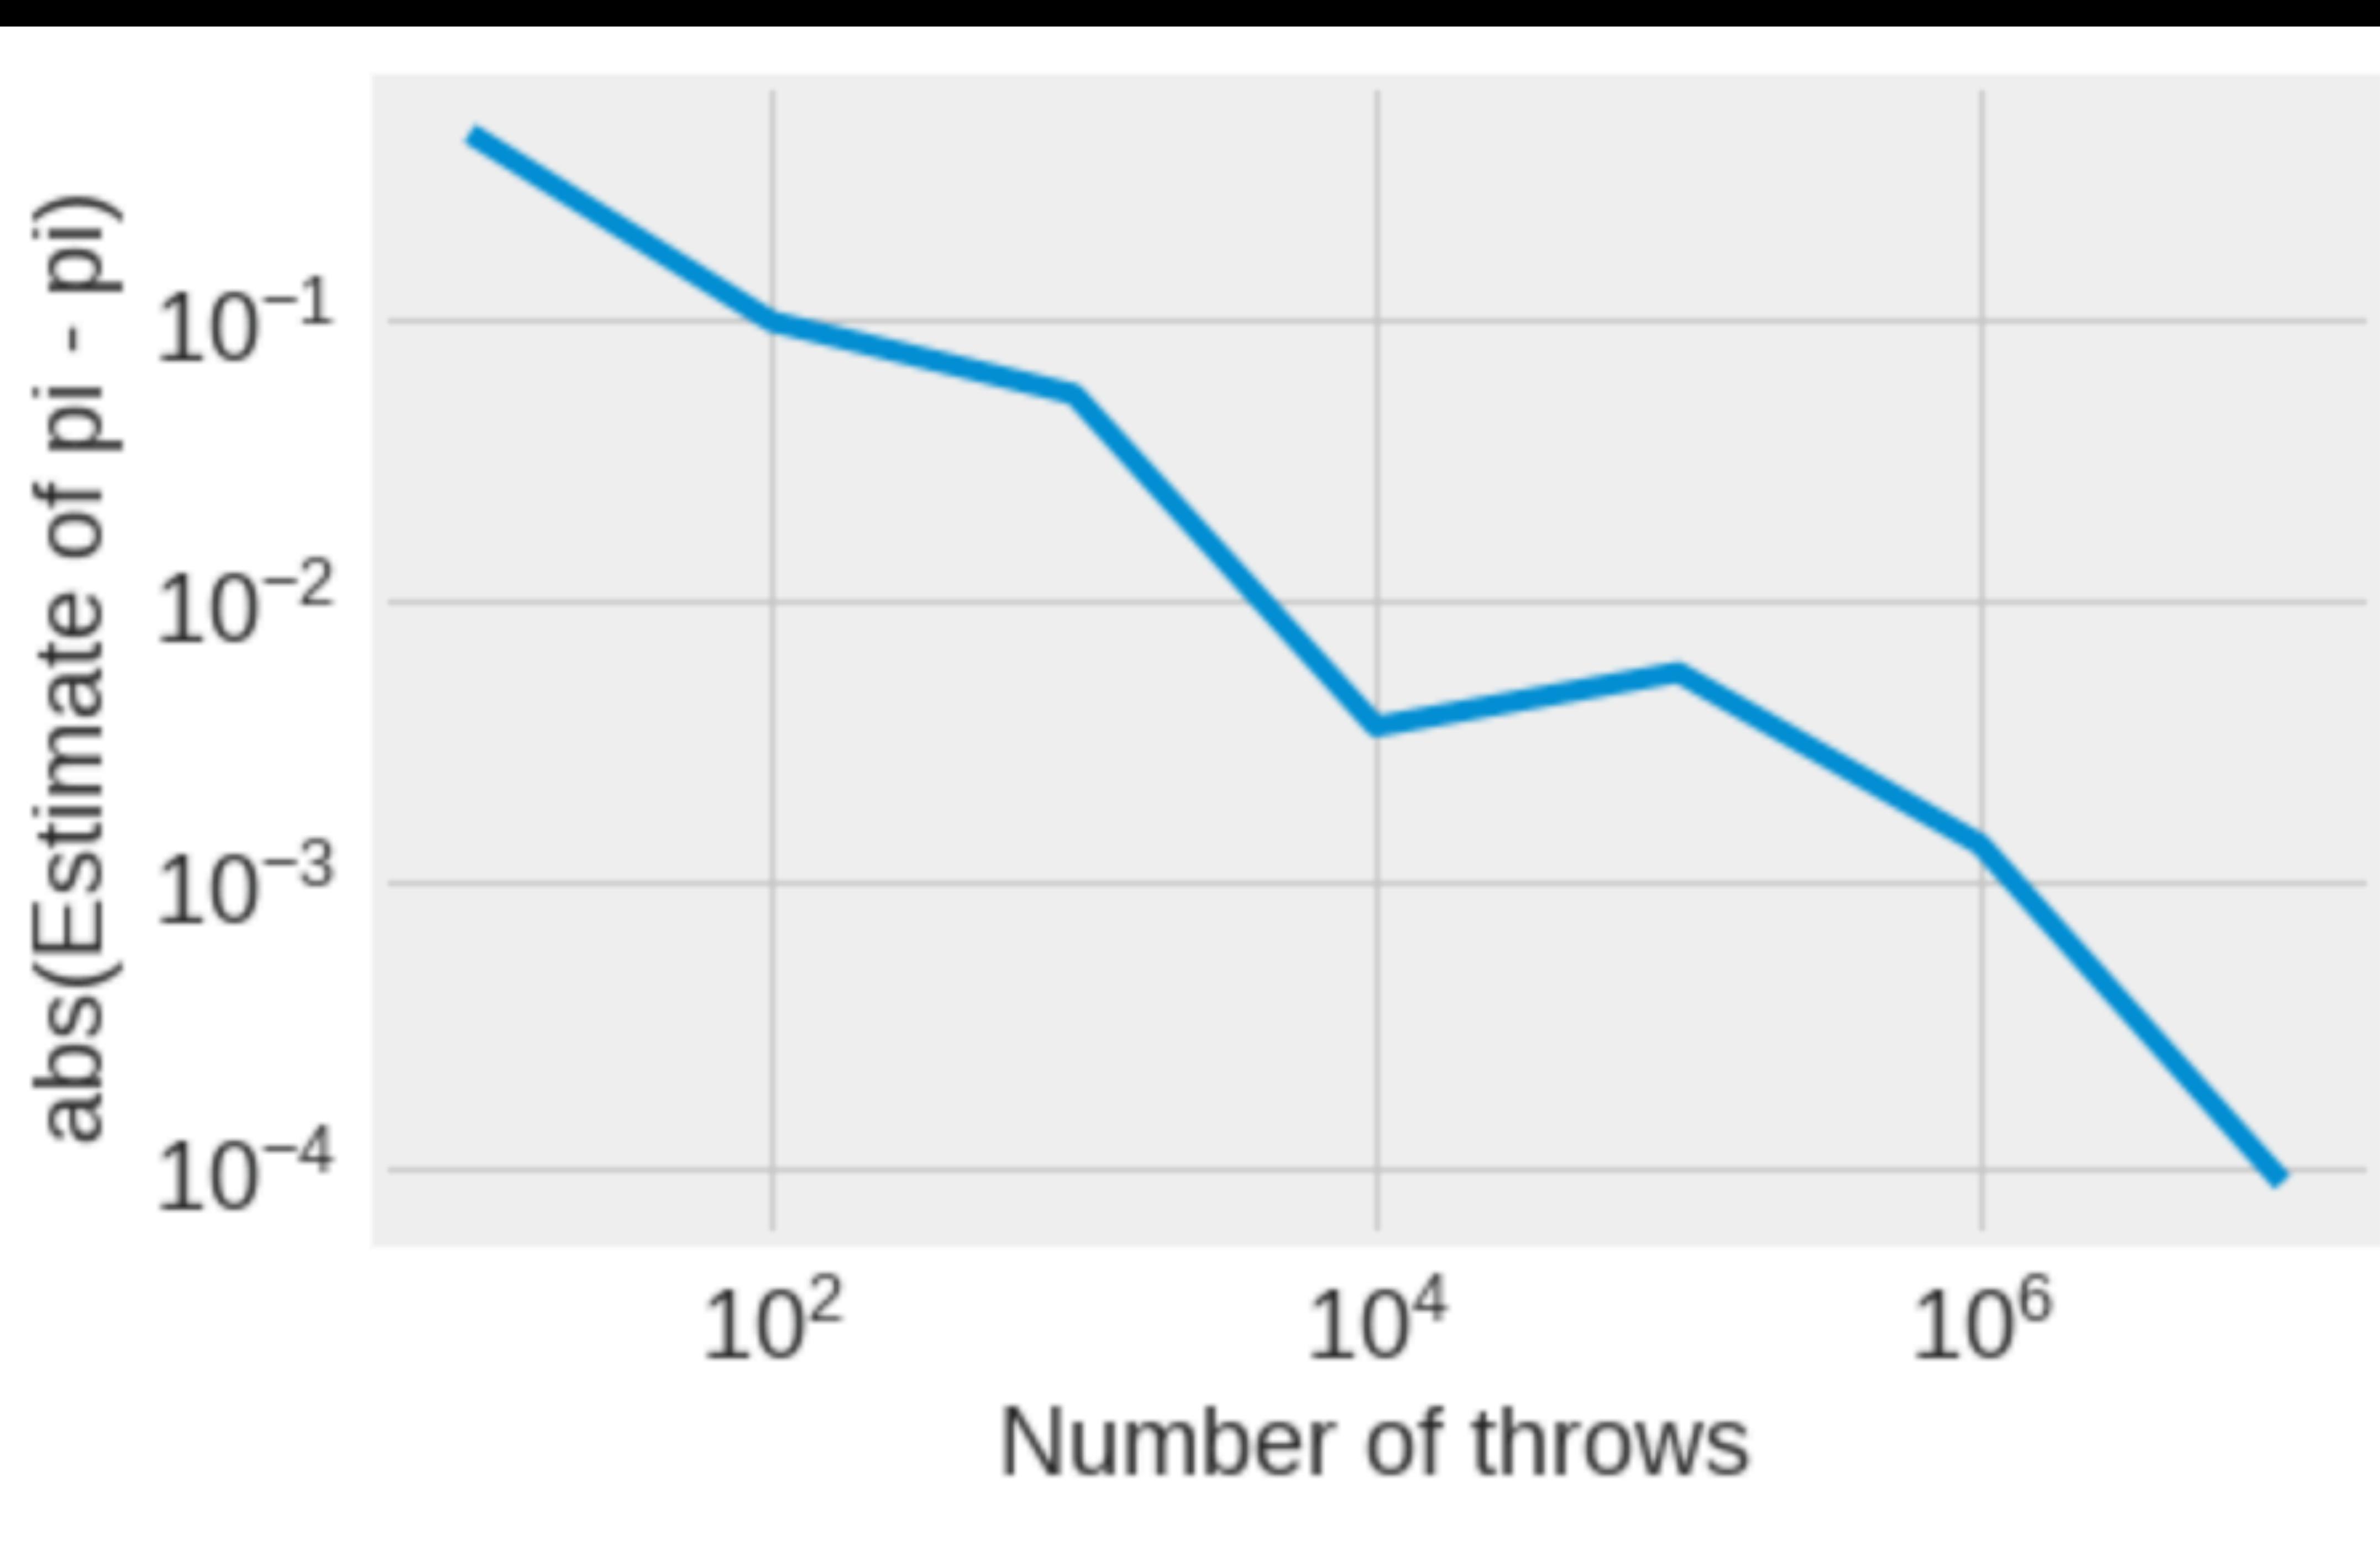

```
trials = [10**j for j in np.arange(0,6)]  
piEstimates = [estimatePi(x) for x in trials]  
print(trials, piEstimates)
```

```
plt.clf()  
plt.plot(trials,np.abs(np.array(piEstimates)-np.pi))  
plt.xlabel("Darts thrown")  
plt.ylabel("pi Estimate")  
plt.xscale('log')  
plt.yscale('log')  
plt.show()
```

Accuracy of the π dart board

- As throws goes up, answer gets closer to pi
- But it's hard to see how close it is later on
- So instead, plot the difference between the estimate and the real answer

Concepts in numerical programming

- Resolution
- Accuracy
- Precision

Low resolution

Entire image: 227KB

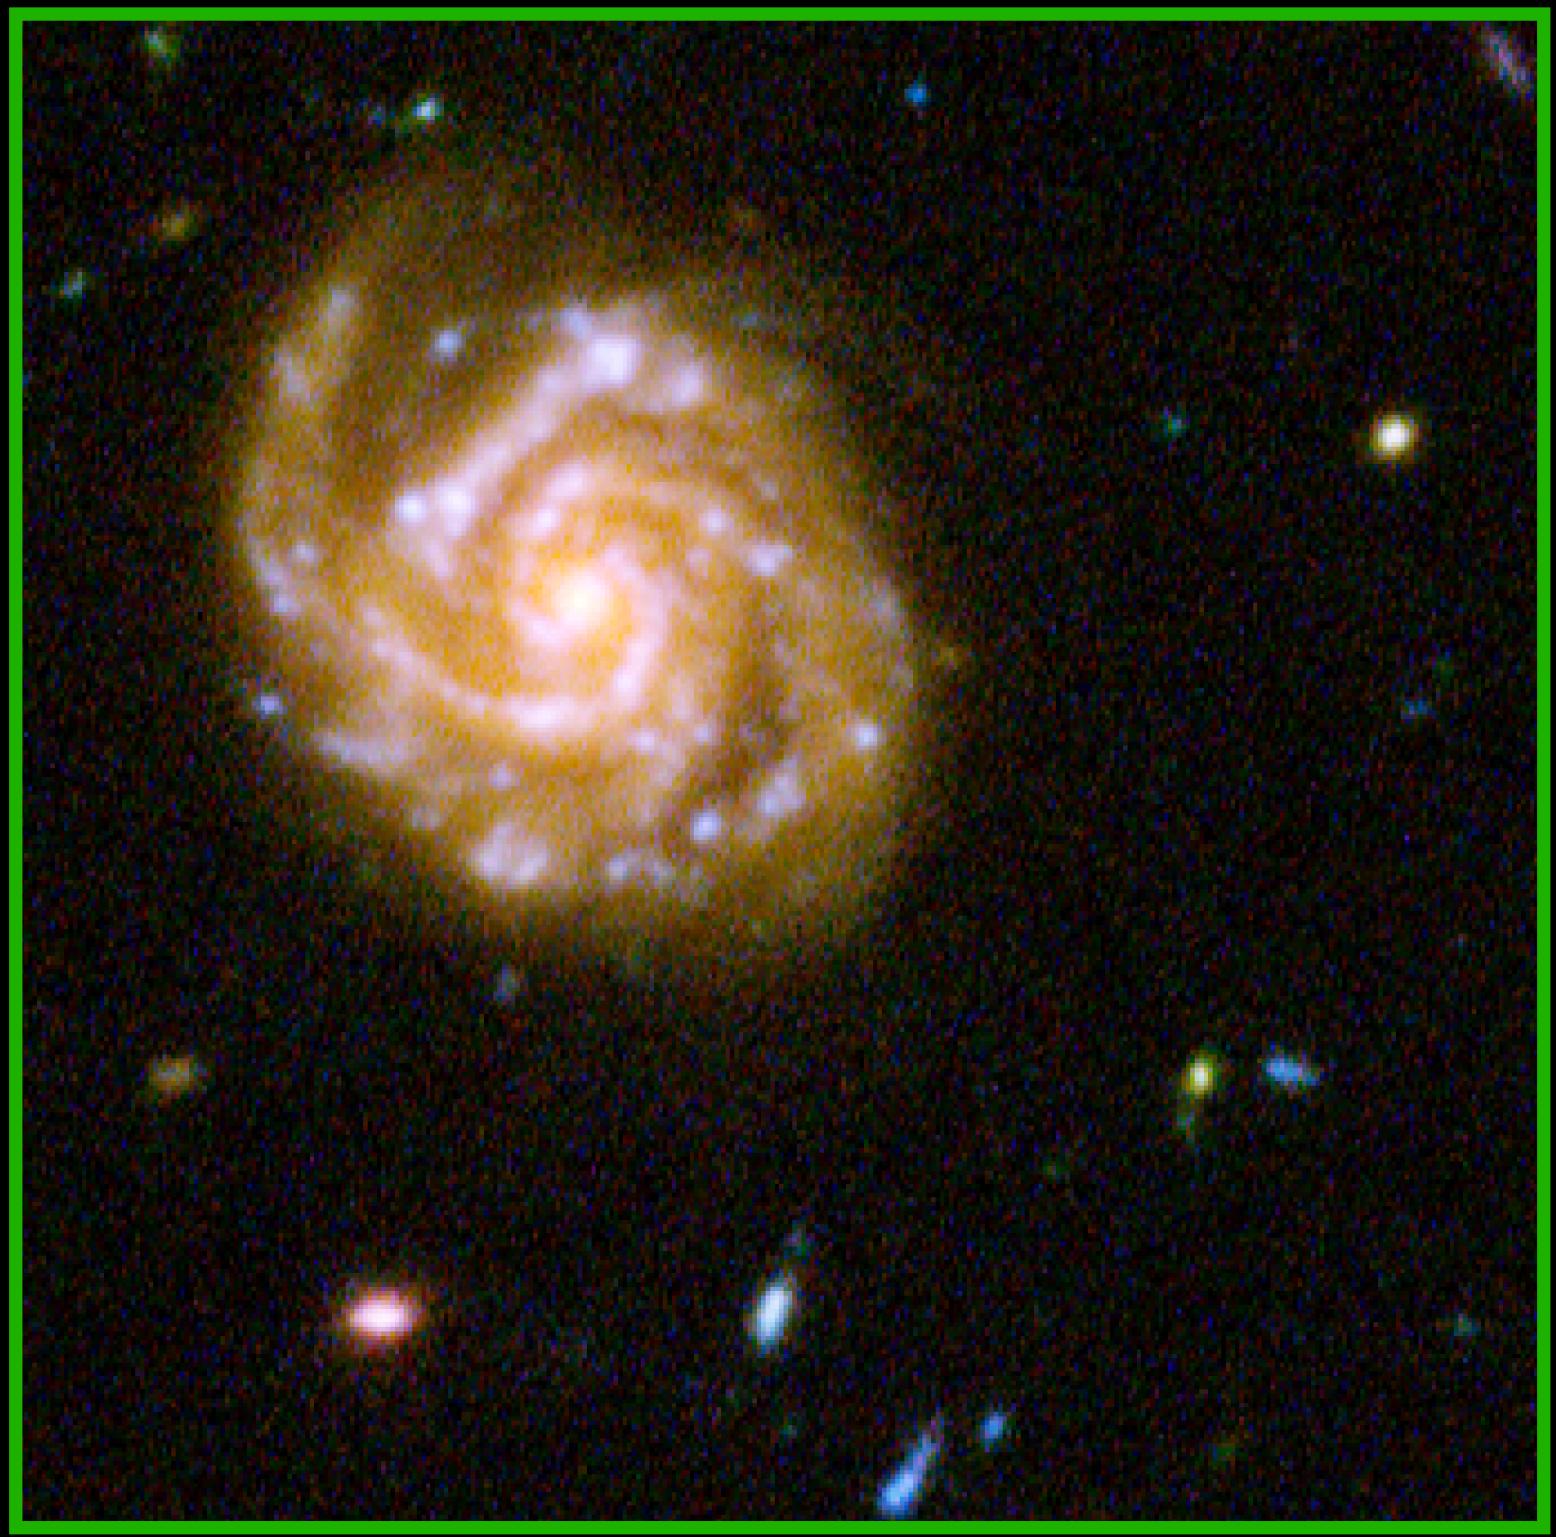

*Large galaxies
1 billion light years away*

*Small galaxies up to
13 billion light years away*

Image courtesy NASA

Resolution

Resolution

High resolution
Entire image: 110MB

*Large galaxies
1 billion light years away*

*Small galaxies up to
13 billion light years away*

Image courtesy NASA

Resolution

- **Low resolution**

- Smaller data
- Faster computation
- Less precise

- **High resolution**

- Bigger data
- Slower computation
- More precise

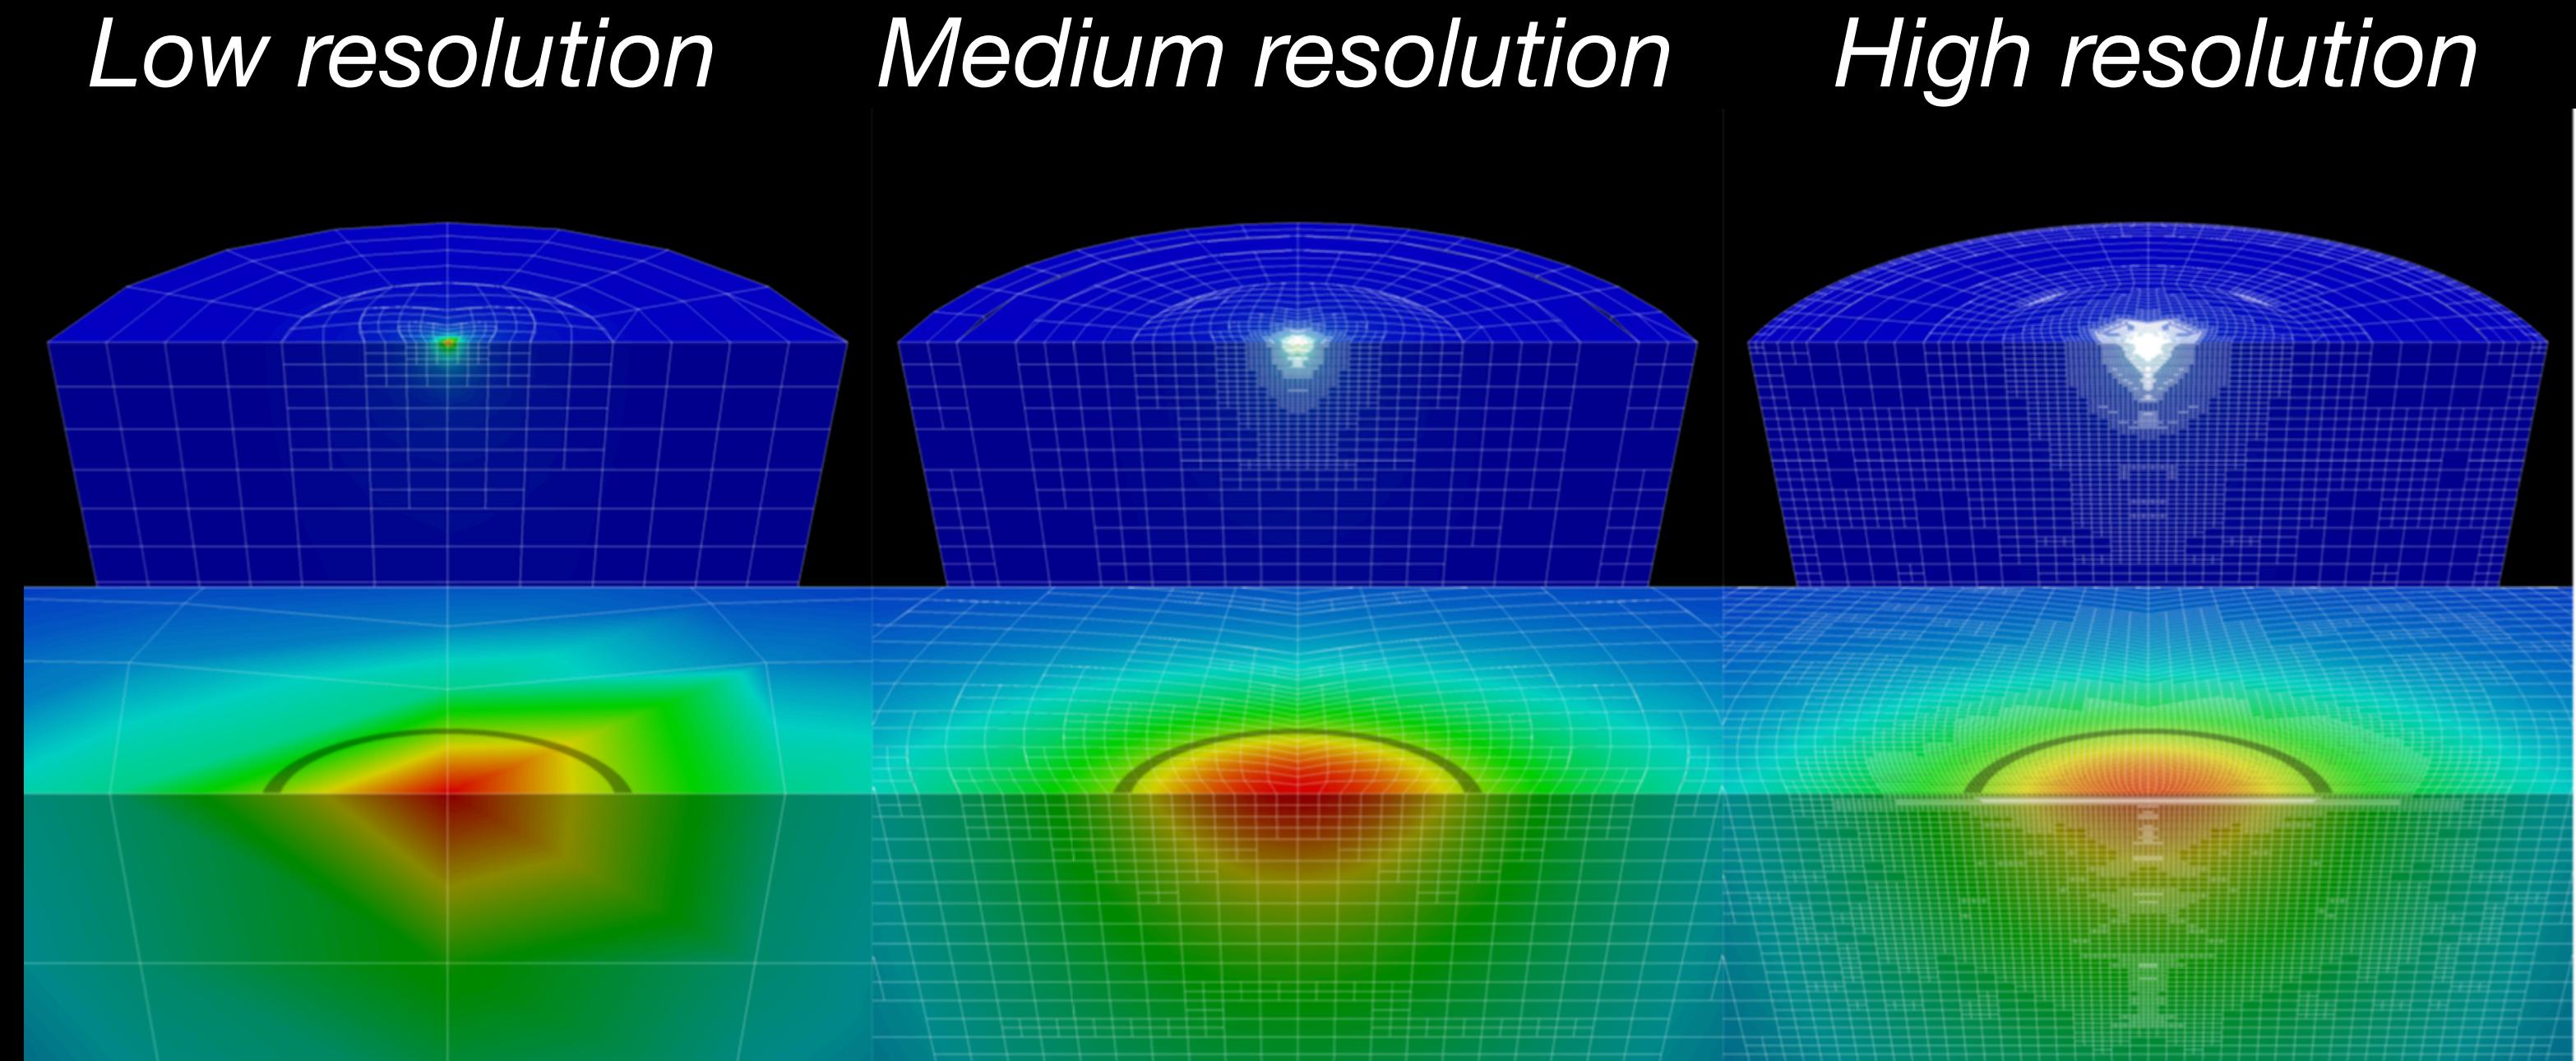

Precision & accuracy

- Precision
 - How much result changes when you add more resolution
 - "How many digits"
- Accuracy
 - How close result is to the correct result

Example: thermal noise

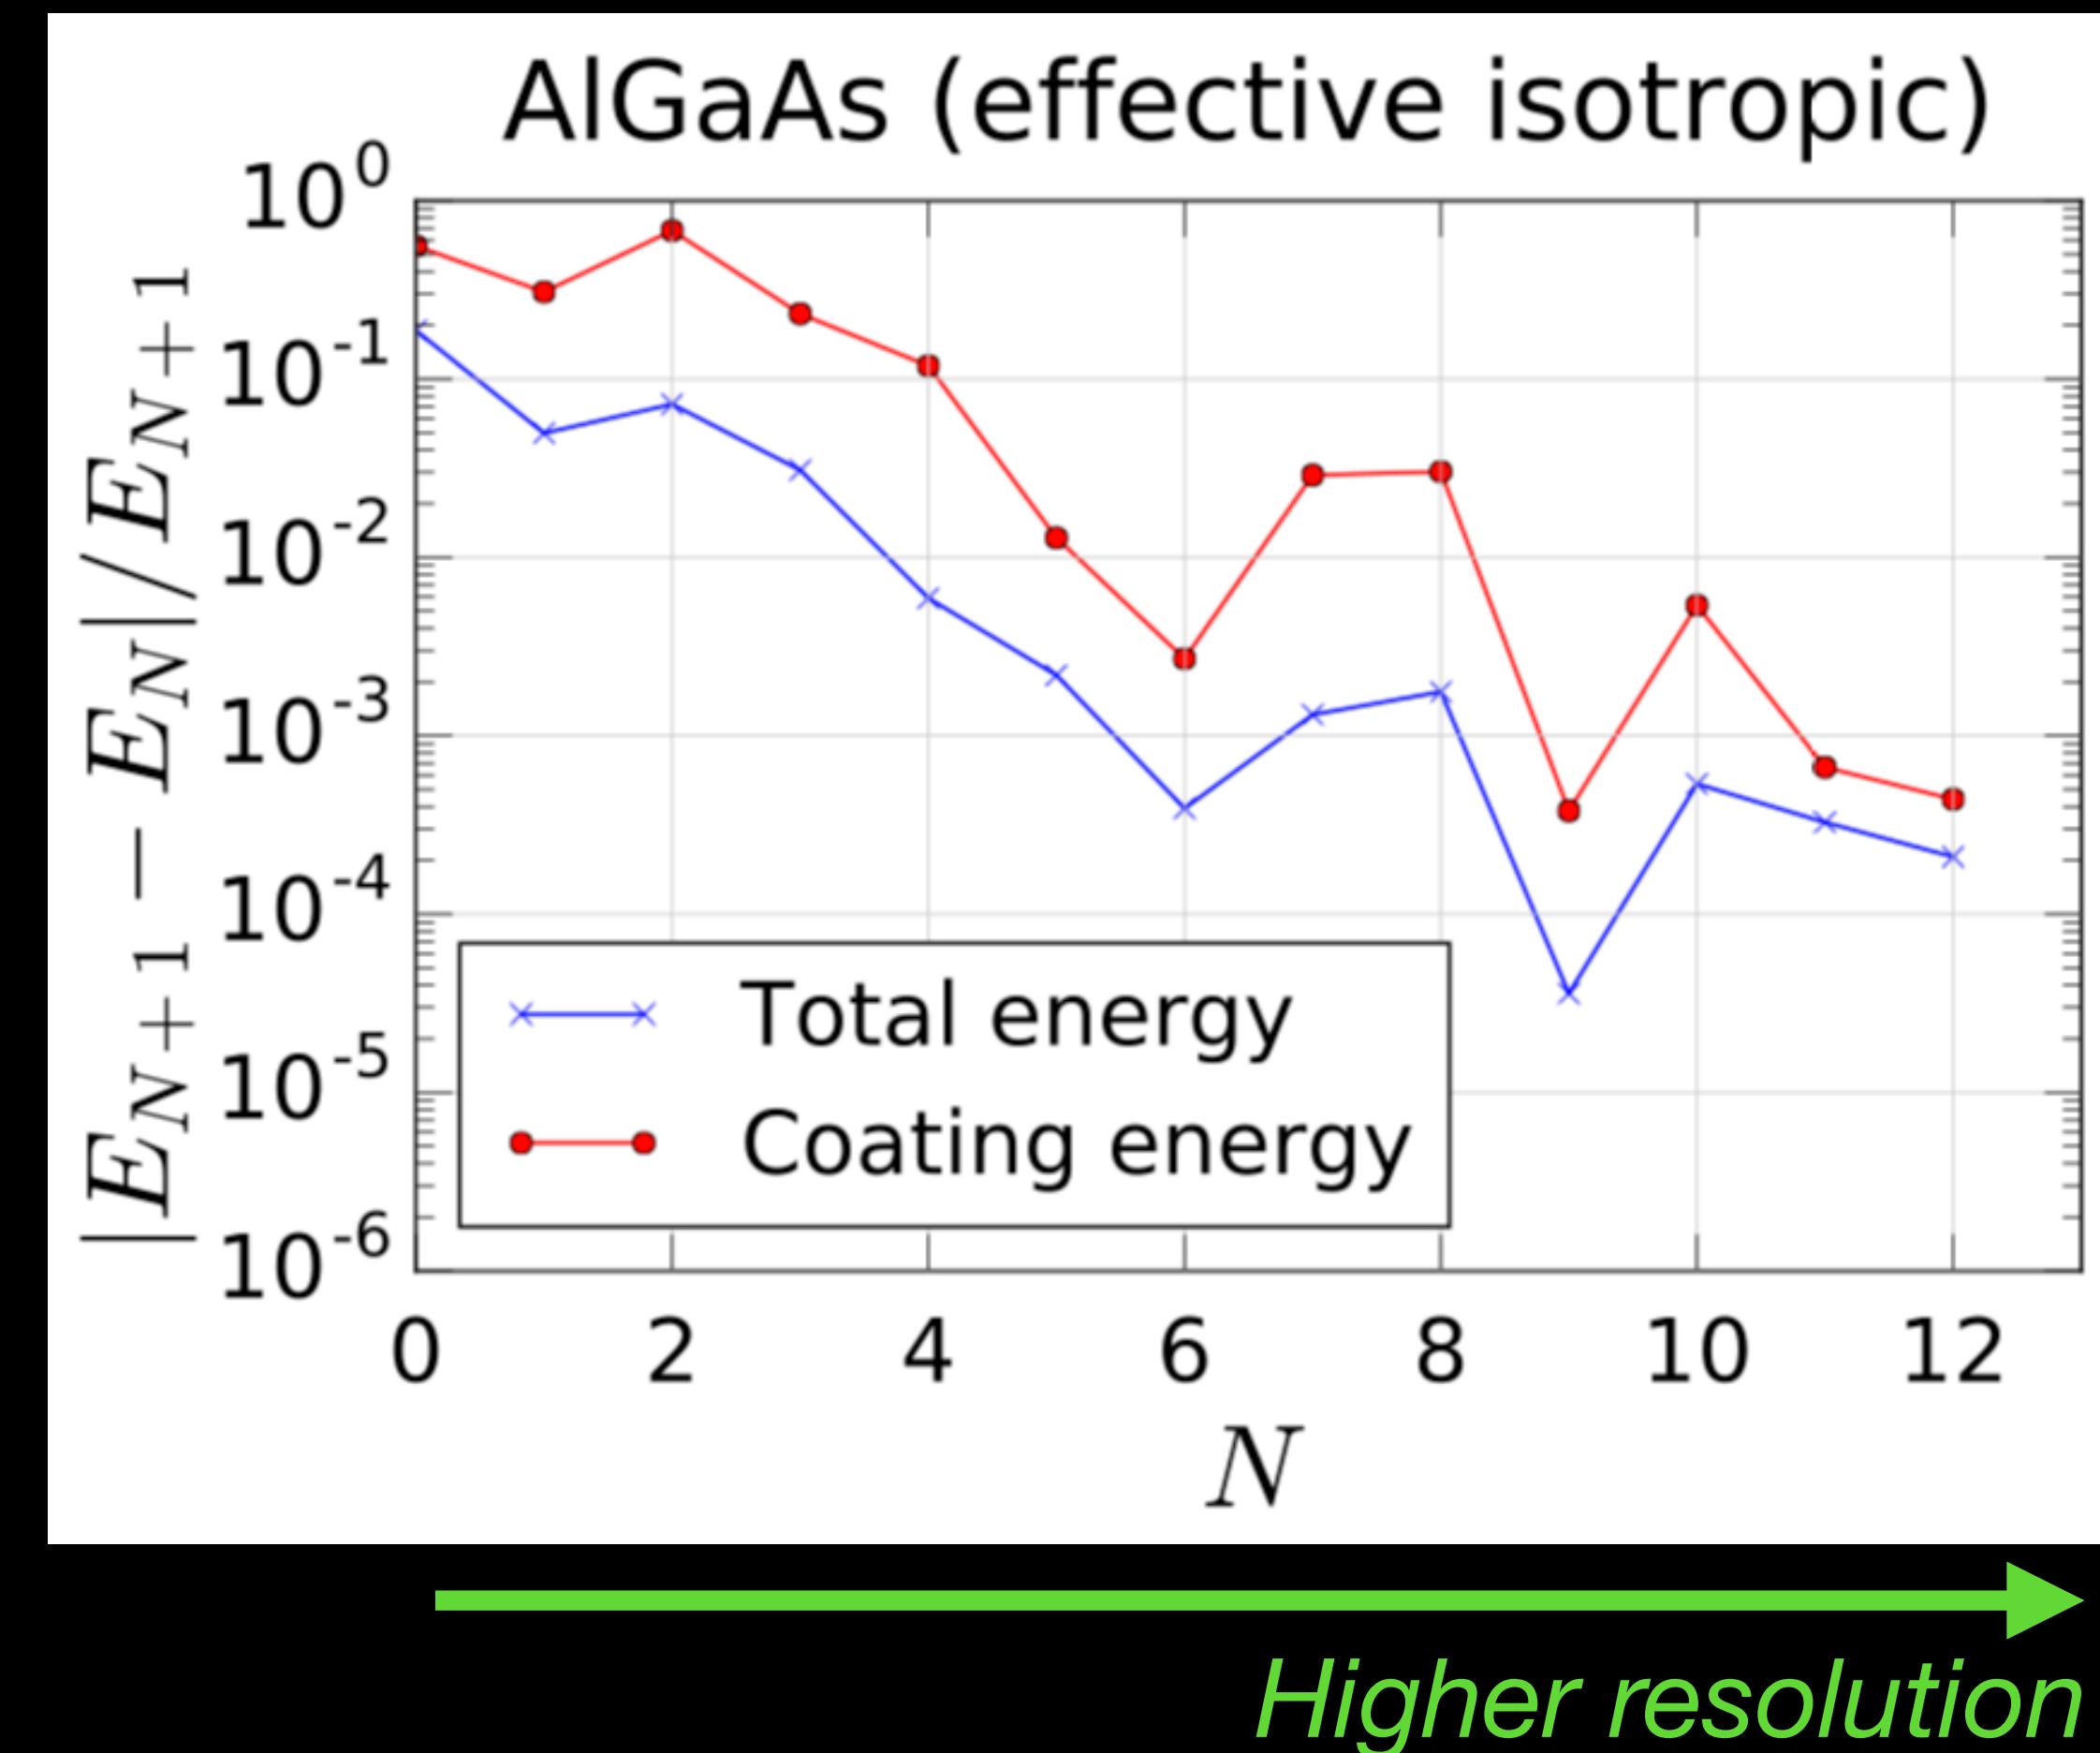

- Thermal noise of a mirror in LIGO depends on how much potential energy it gets when you push on the face

Color = how much mirror deforms

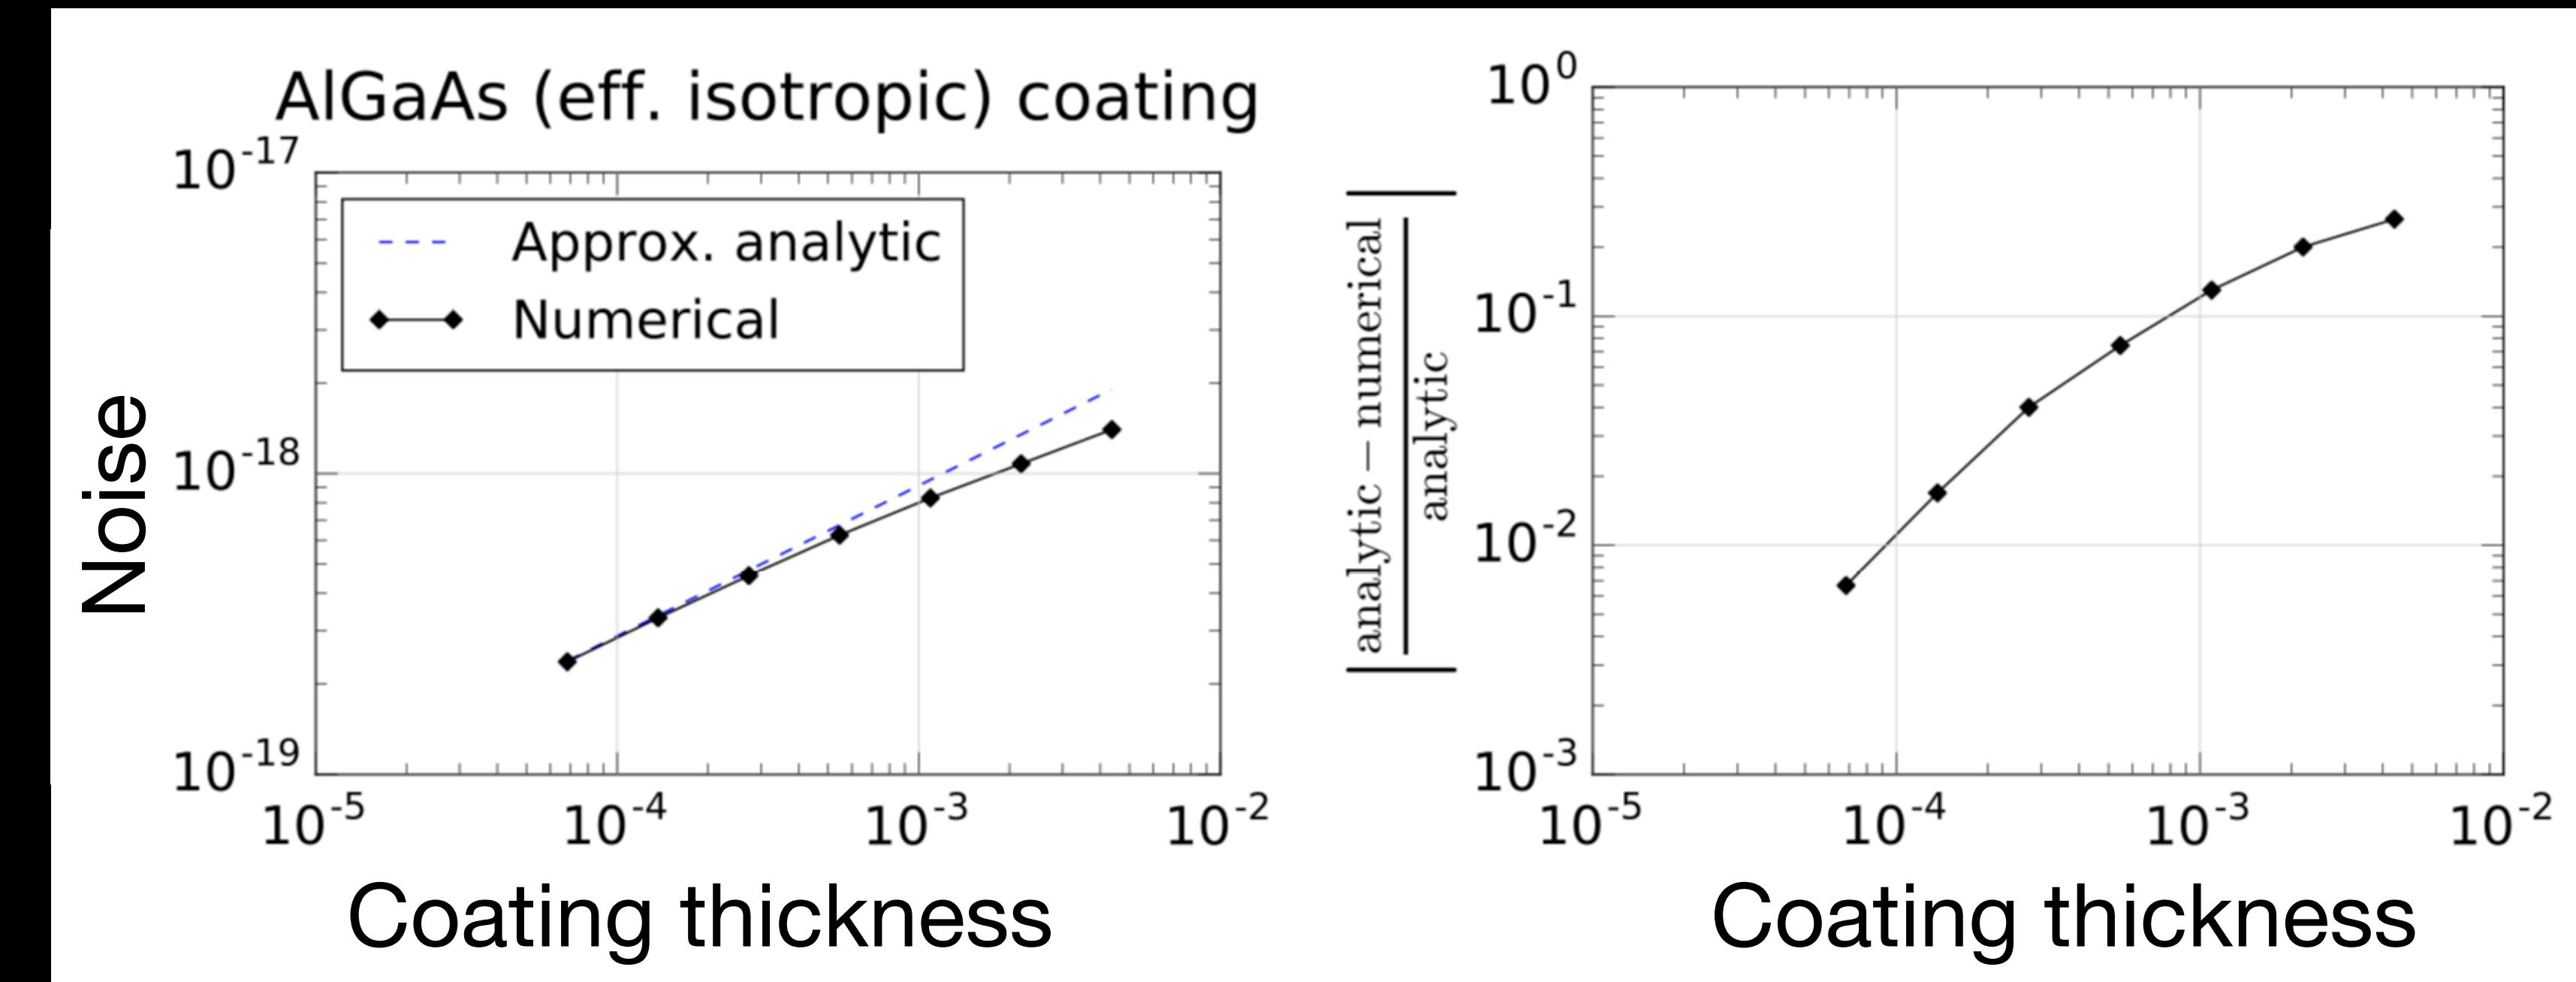

Example: thermal noise

- Potential energy E in deformed mirror
- Precision of energy as resolution increases
- Label resolution by integer N

Example: thermal noise

- Thermal noise of thin coating
- Accuracy: compare code to known "analytic" solution

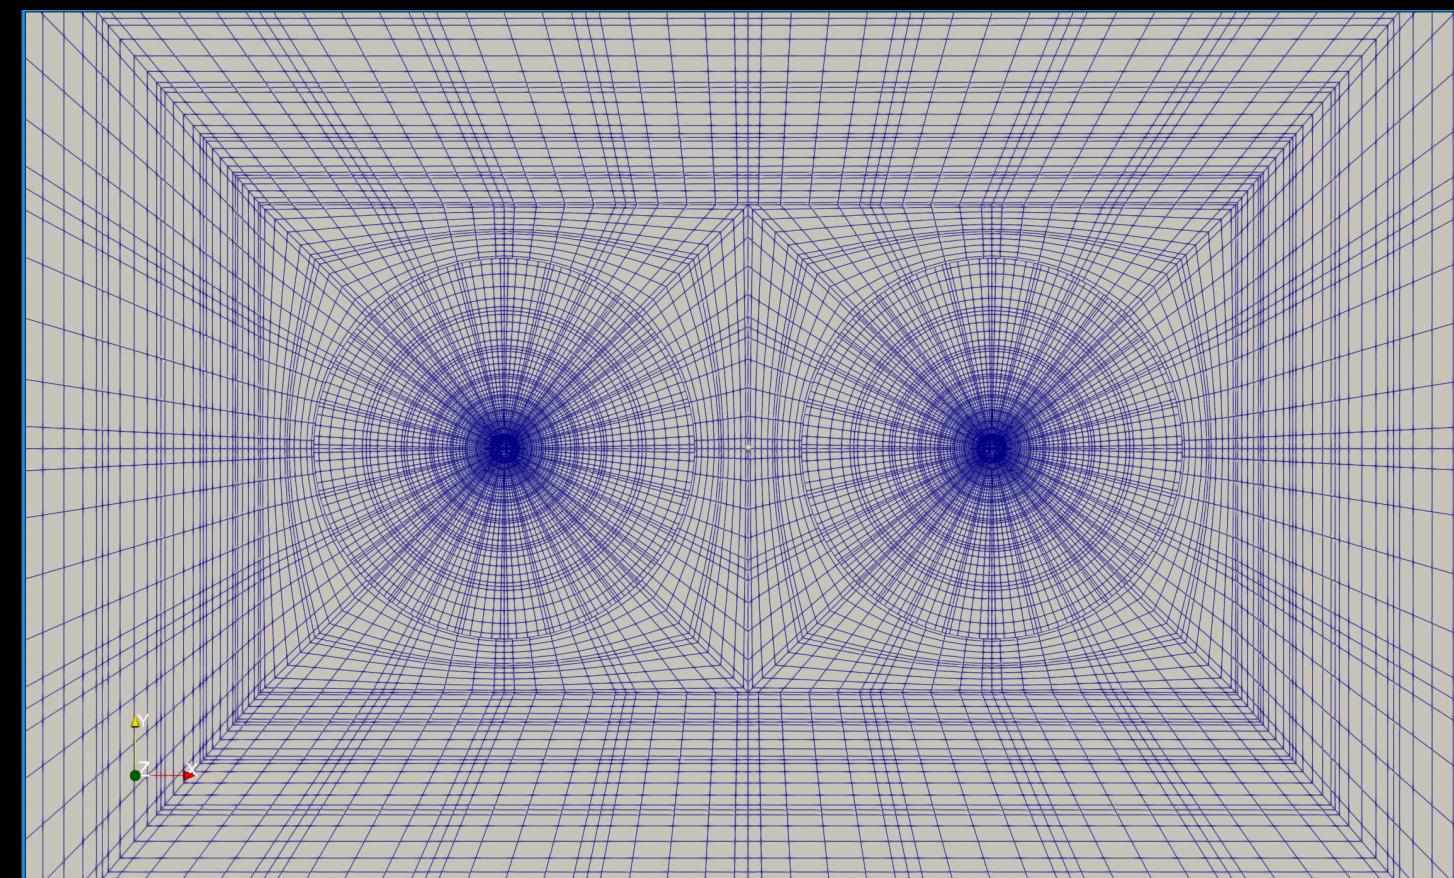

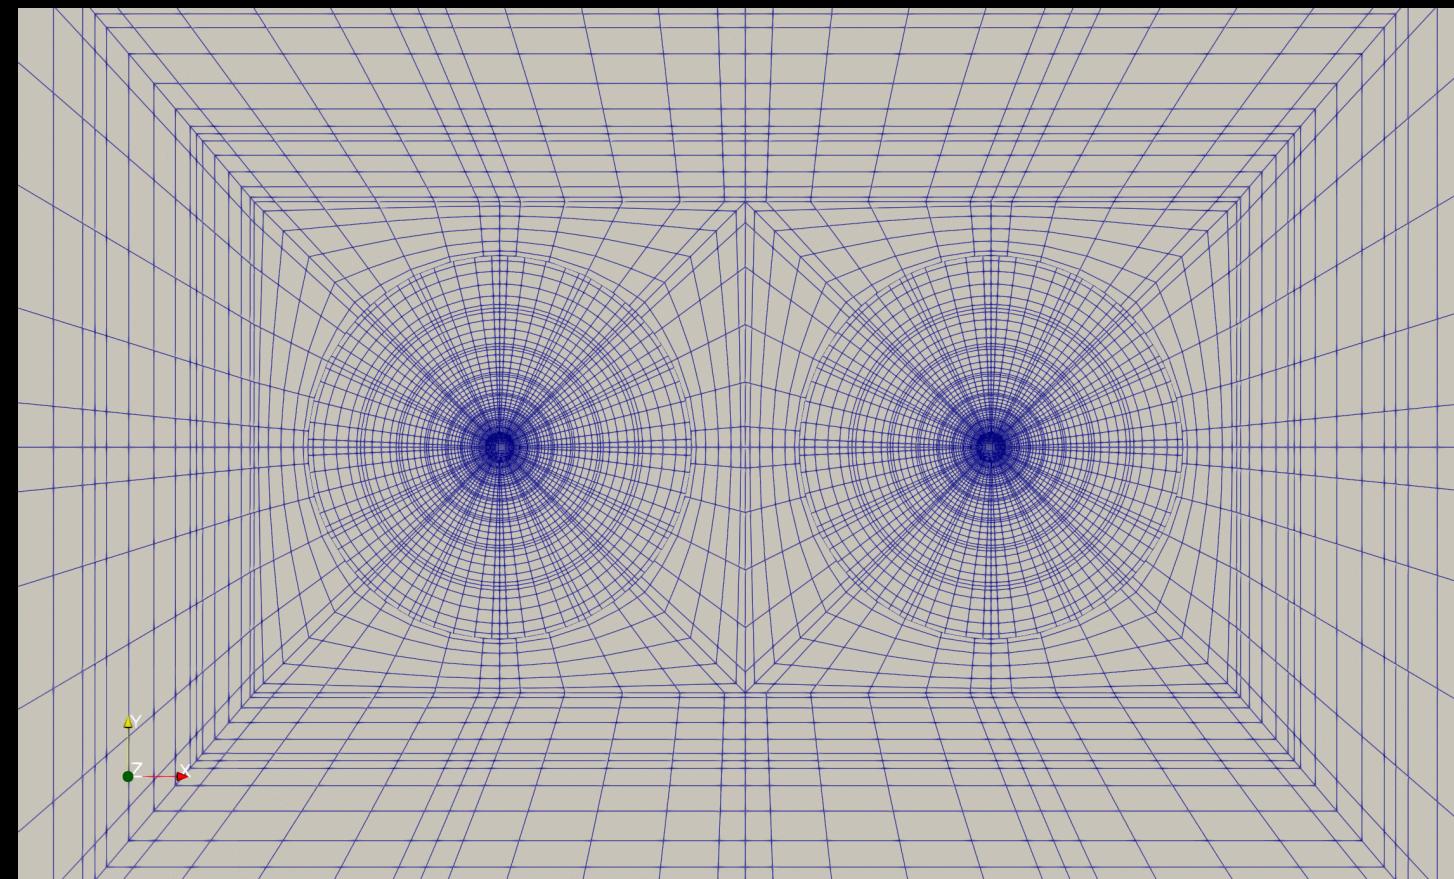

Example of resolution

3-index constraint

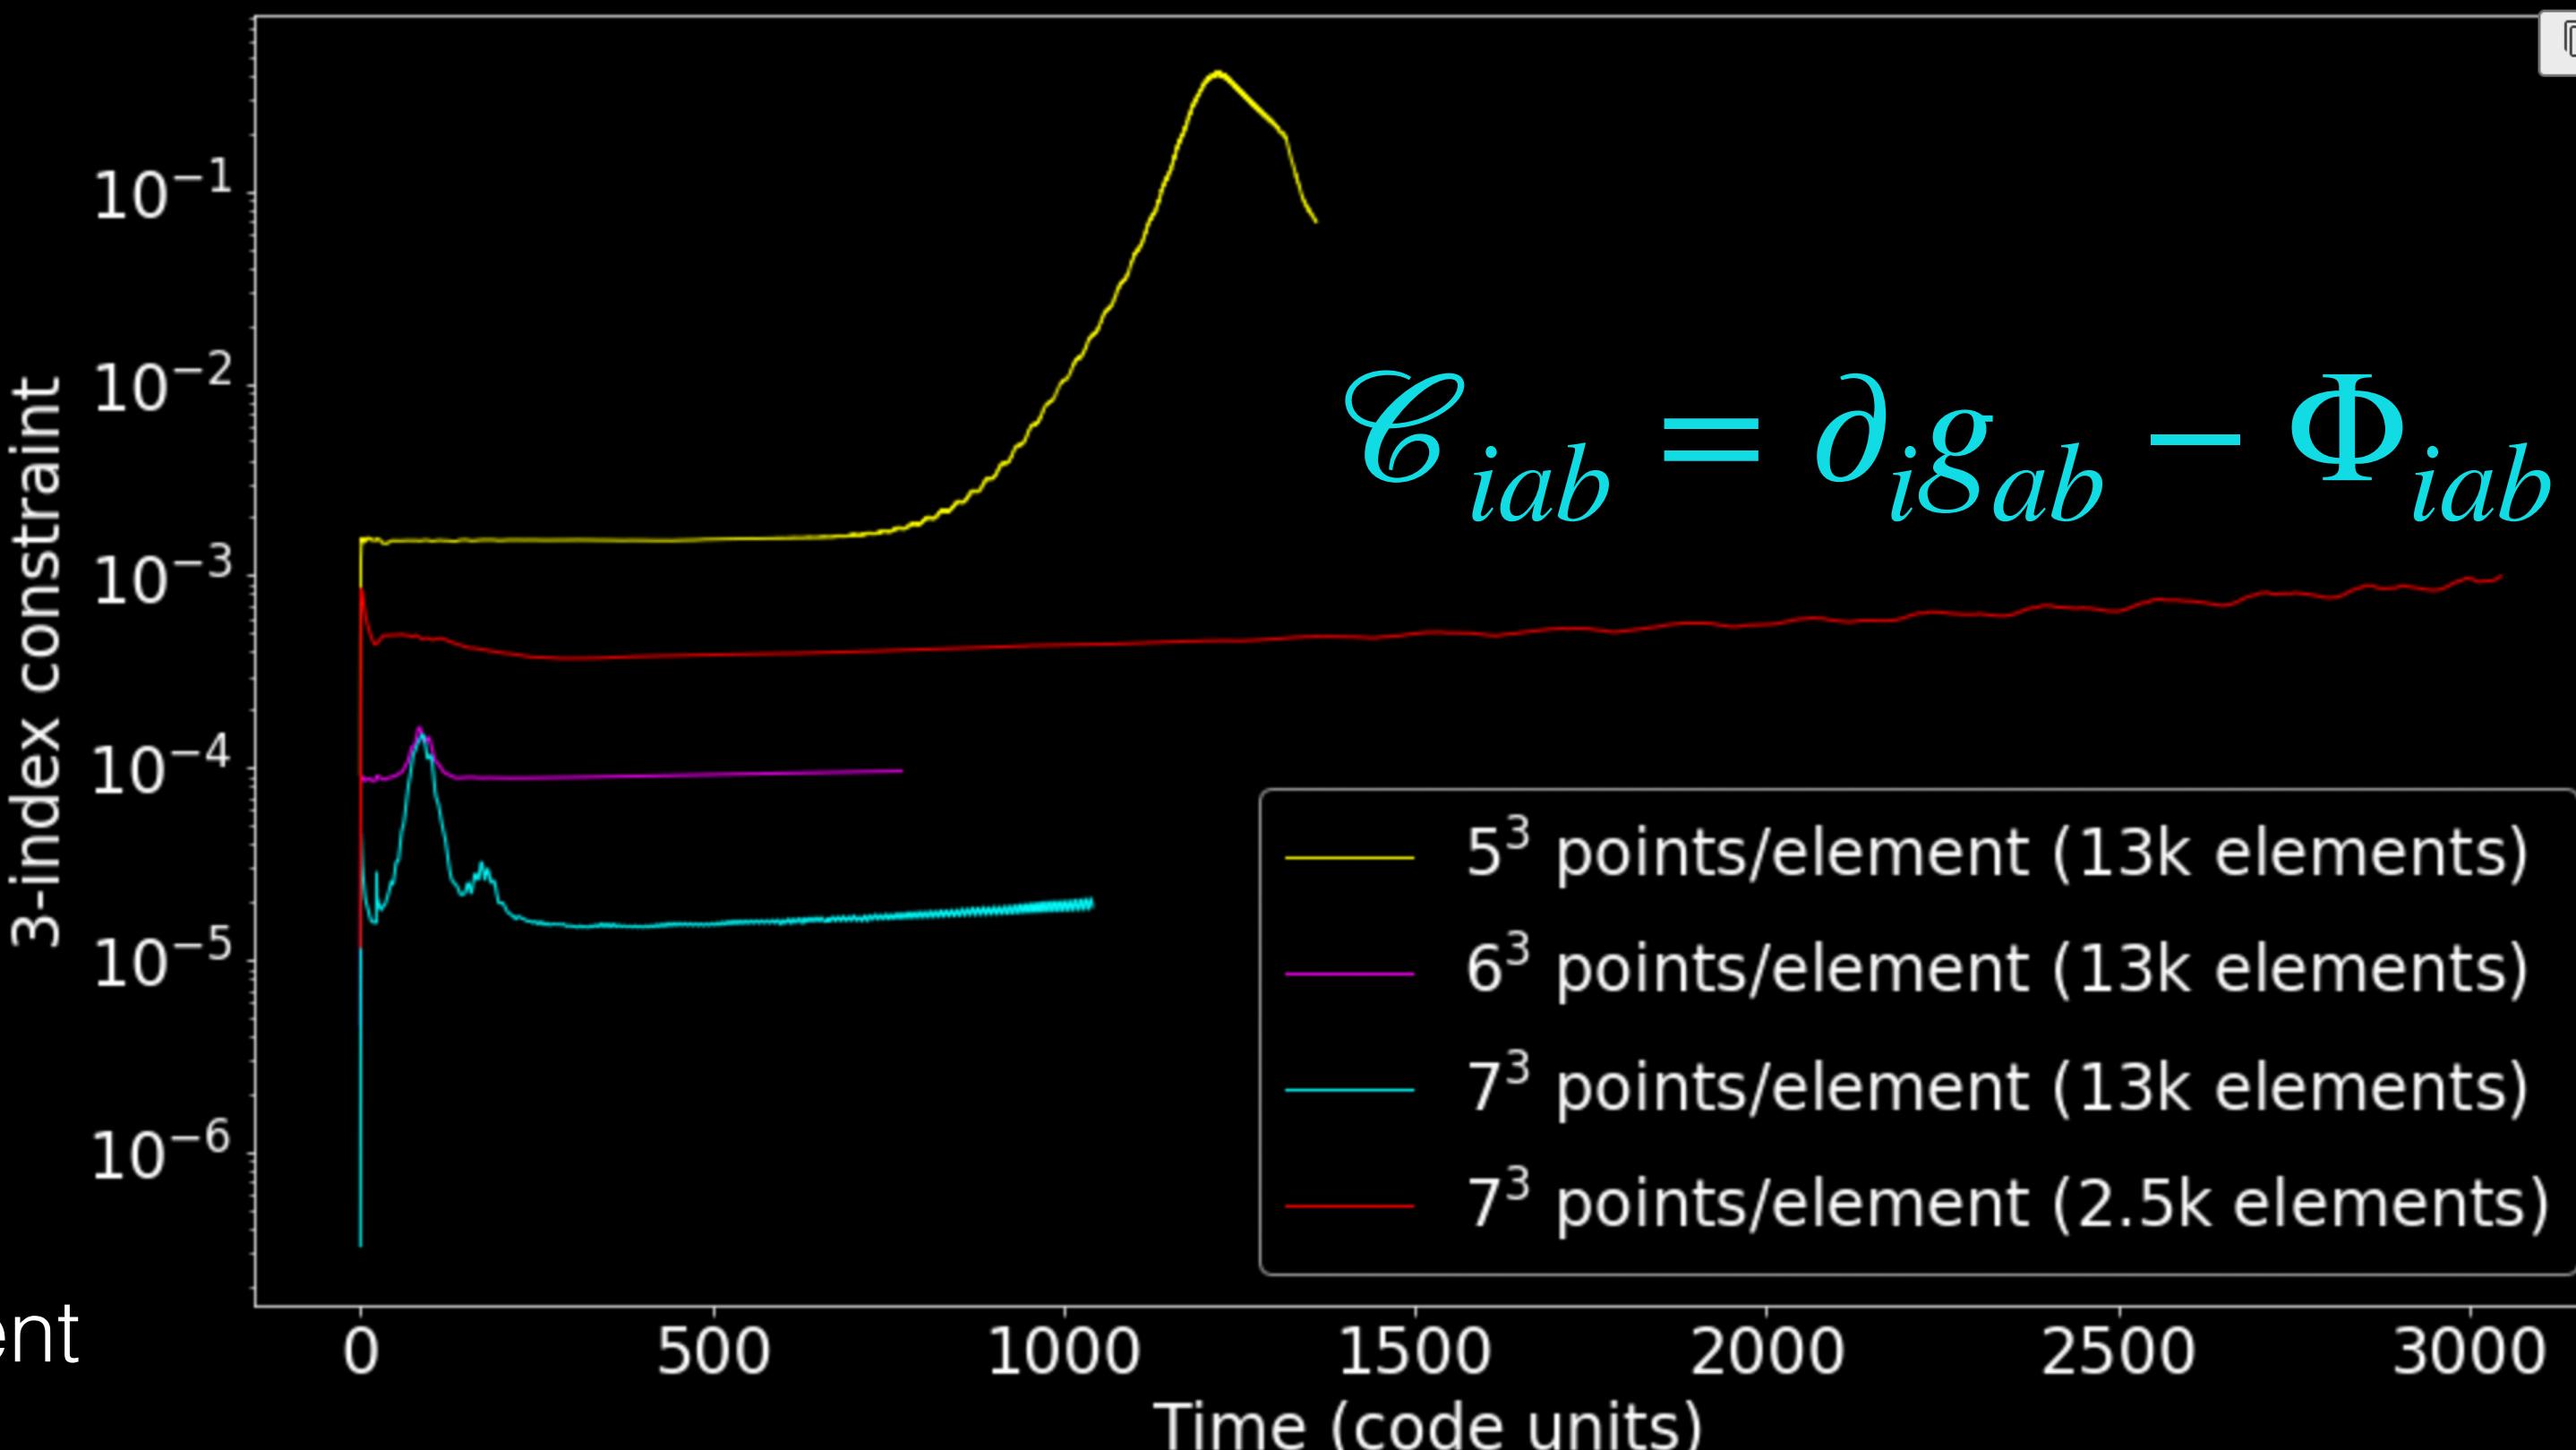

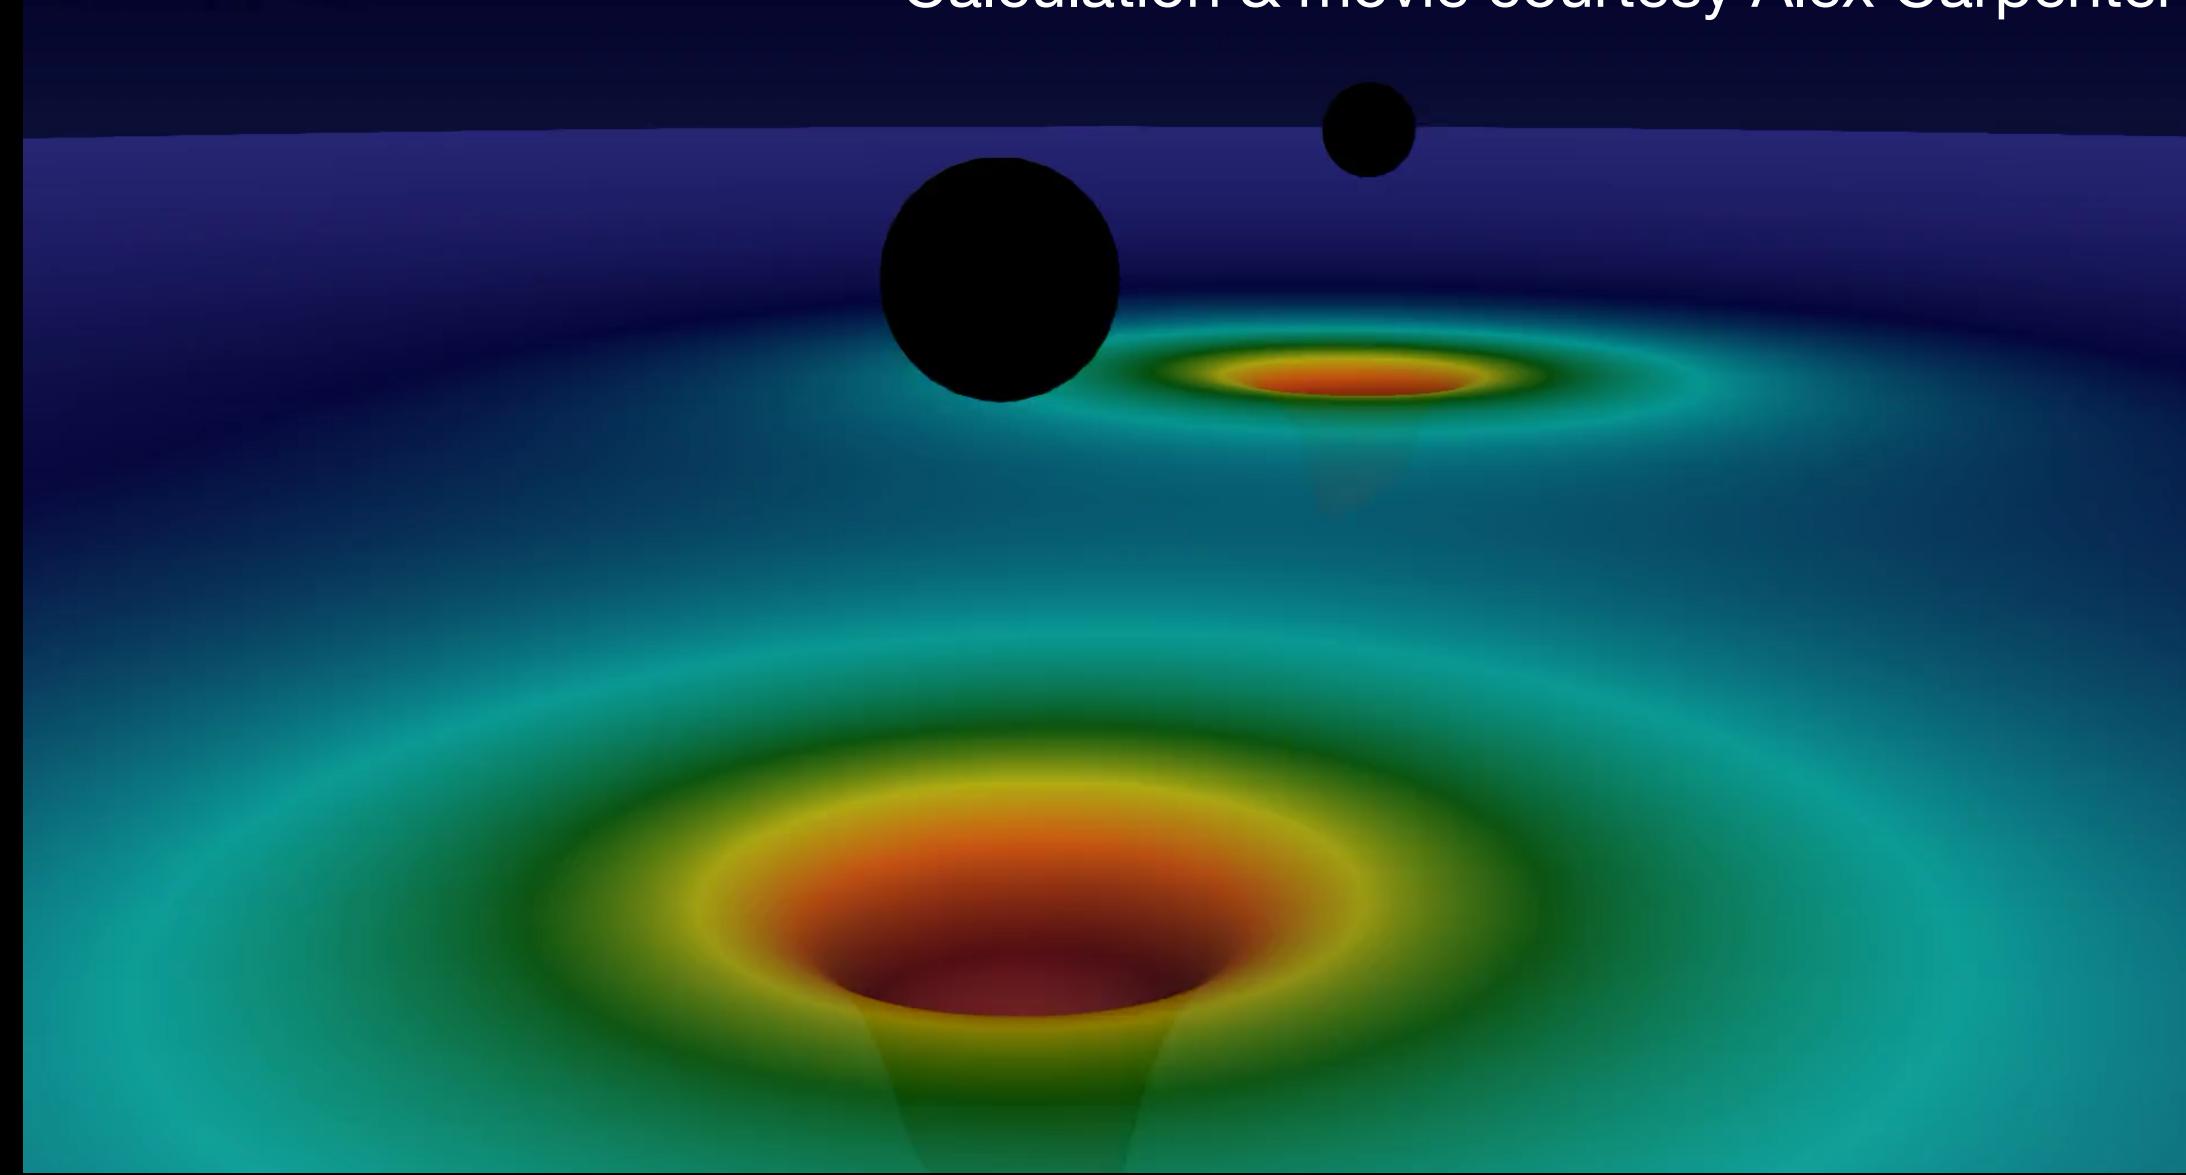

2.5k elements

7^3 points/element

13k elements

7^3 points/element

$$\mathcal{C}_{iab} = \partial_i g_{ab} - \Phi_{iab}$$

- 5^3 points/element (13k elements)
- 6^3 points/element (13k elements)
- 7^3 points/element (13k elements)
- 7^3 points/element (2.5k elements)

Time (code units)

UNIX command line crash course activity

- Commands to know
 - ls, pwd, cd, mkdir
 - ./, ../, paths
 - cp, mv, rm, rmdir
 - cat, less
 - nano
 - whoami, date, ...
- Play along with me...
 - mkdir YOURNAME and cd into it
 - Navigate file system: ls, pwd, cd, ./ and ../
 - Use nano to write a text file
 - Copy, rename, remove a file
 - Cat, less, more, head, tail
 - > to redirect output
 - Grab bag: whoami, date, grep, sed, zip...
